3.3 SPT-BASED LIQUEFACTION ASSESSMENT FOR SAND-LIKE SOILS

3.3.1 1 Hz Design Earthquake

Project Name = KIF TDEC Seismic Stability

Boring ID = KIF-B05

Boring Location

Northing =

Easting =

OR

Baseline Station =

Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) = 4.625 inches

Top of Hole Elevation = 756.5 feet

Water Depth during SPT (negative for U/S borings)= 52 feet

Depth Sampling Began = 0 feet

Total Unit Wt. above 1st SPT = pcf

Assumed Rod Stickup = 5 feet *(Typ assume 5ft)*

E_m Measurement based on Fv method? = 1 (1: Yes, 0: No)

SPT Sampler w/ Liners? = 0 (1: Yes, 0: No) *(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) = 5.9 feet

Final Grade Elevation during EQ = 756.5 feet

Average Total Unit Wt. of Cut/Fill = pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? = 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? = 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-B09_NOR

Alpha at each sample depth known? = 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: Alternate, KIF-B05_NOR

Get CSR from shear stress envelope? = 0 (1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known? = (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:
m3:
m2:
m1:

Earthquake Information

EQ Source (e.g., New Madrid): 1 Hz

Event (e.g., MCE, 10KEQ, OBE): Design EQ

a_{max} (g) (top of ground surface): 0.10

EQ Mag (Mw): 7.6

OR

Baseline Station =

Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) = 5.875 inches

Top of Hole Elevation = 733.9 feet

Water Depth during SPT (negative for U/S borings)= -2.8 feet

Depth Sampling Began = 0 feet

Total Unit Wt. above 1st SPT = 62.4 pcf

Assumed Rod Stickup = 5 feet *(Typ assume 5ft)*

E_m Measurement based on Fv method? = 1 (1: Yes, 0: No)

SPT Sampler w/ Liners? = 0 (1: Yes, 0: No) *(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) = -3.5 feet

Final Grade Elevation during EQ = 733.9 feet

Average Total Unit Wt. of Cut/Fill = pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? = 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? = 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: Alternate, KIF-B06_NOR

Alpha at each sample depth known? = 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

Baseline Station =

Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) = 5.875 inches

Top of Hole Elevation = 730.8 feet

Water Depth during SPT (negative for U/S borings)= -5.5 feet

Depth Sampling Began = 0 feet

Total Unit Wt. above 1st SPT = 62.4 pcf

Assumed Rod Stickup = 5 feet *(Typ assume 5ft)*

E_m Measurement based on Fv method? = 1 (1: Yes, 0: No)

SPT Sampler w/ Liners? = 0 (1: Yes, 0: No) *(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) = -6.6 feet

Final Grade Elevation during EQ = 730.8 feet

Average Total Unit Wt. of Cut/Fill = pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? = 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? = 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-B12_NOR

Alpha at each sample depth known? = 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-B10_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m2:
m1:
m0:

Associated ground response profile: Section_AA, KIF-B10_NOR
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

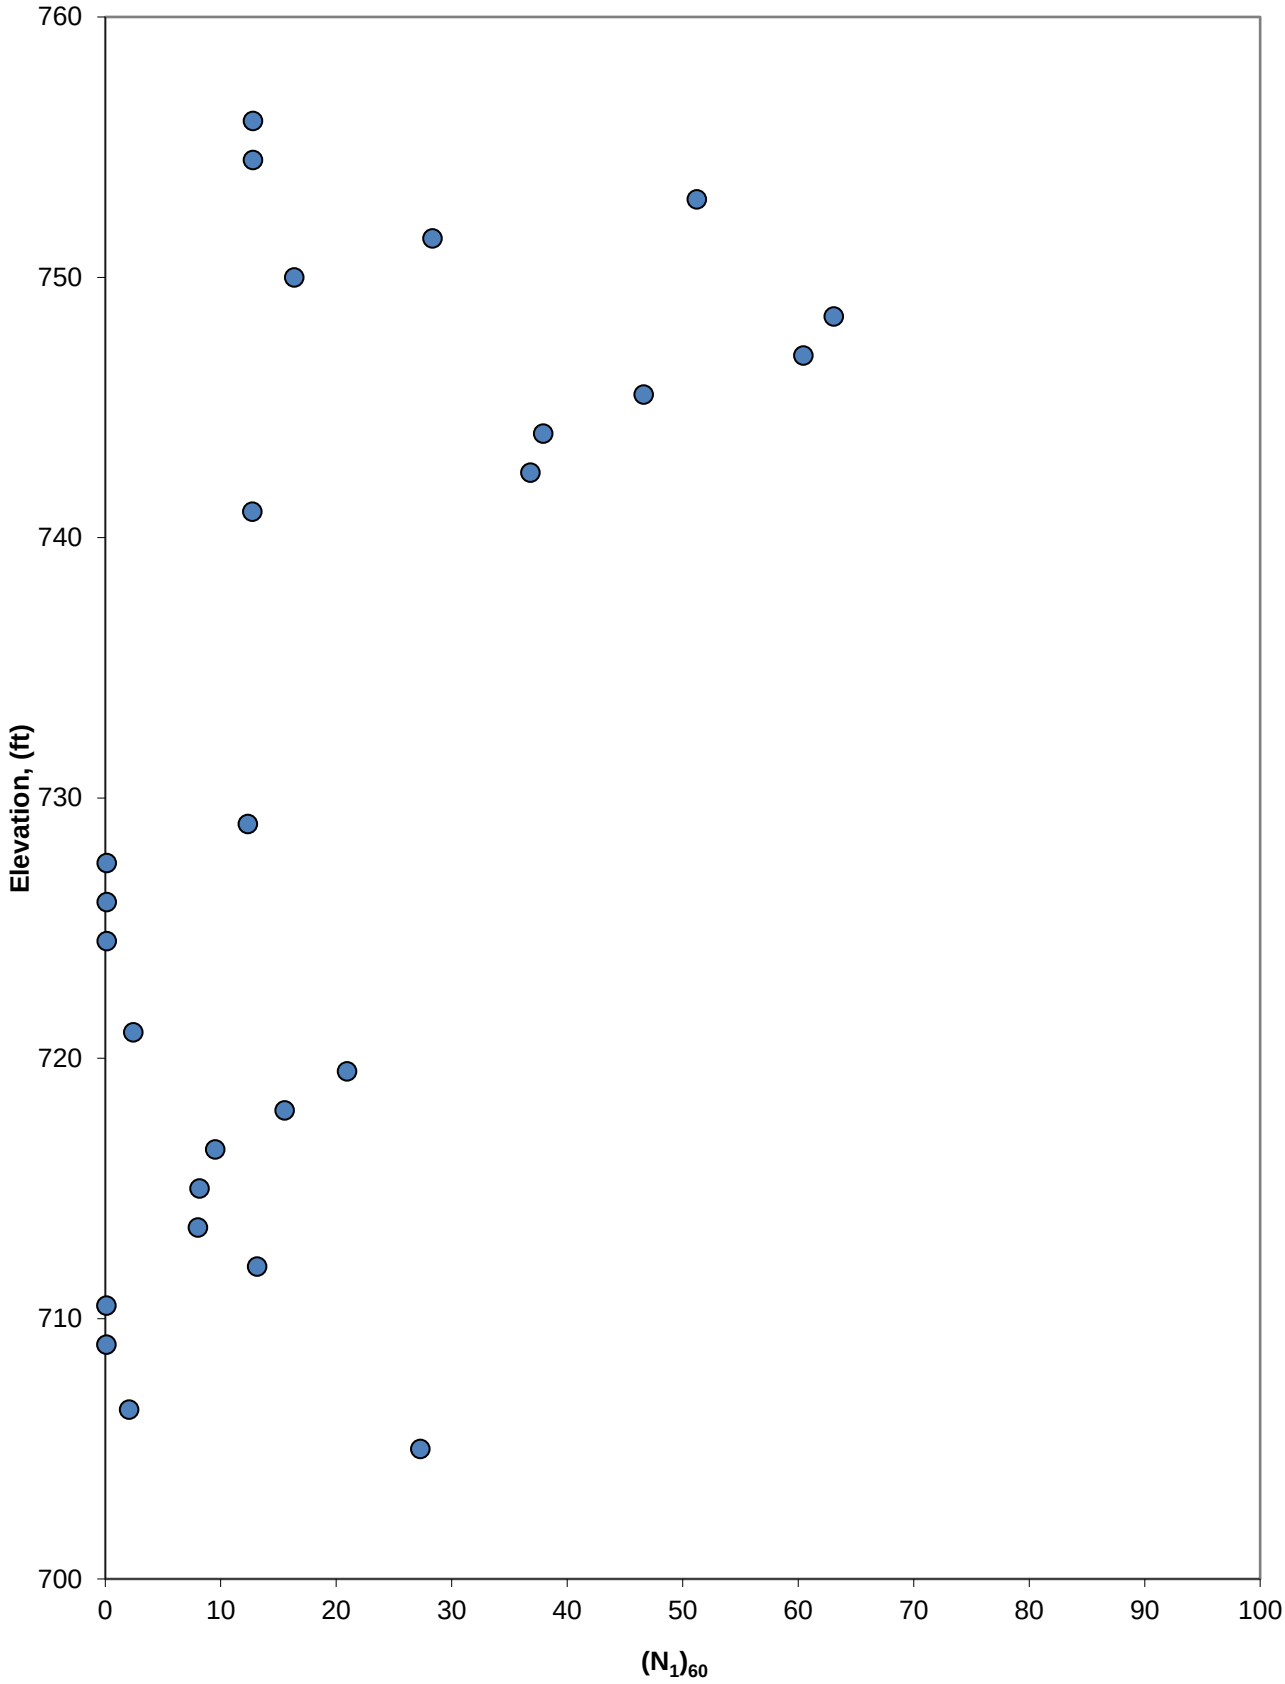
KIF TDEC Stability, Boring ID: KIF-A1, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability

Boring ID = KIF-A2

Boring Location

Northing =

Easting =

OR

Baseline Station =

Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	755	feet	
Water Depth during SPT (negative for U/S borings)=	13	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ	755.3	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-A2_NOR

Alpha at each sample depth known? 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4: m3: m2: m1: m0:

Associated ground response profile: Section_AA, KIF-A2_NOR

Get CSR from shear stress envelope? 0 (1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known? (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4: m3: m2: m1:

Boring ID = KIF-A3

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	747	feet	
Water Depth during SPT (negative for U/S borings)=	0	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	6	feet
Final Grade Elevation during EQ	753.3	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-A3_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: Section_AA, KIF-A3_NOR
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

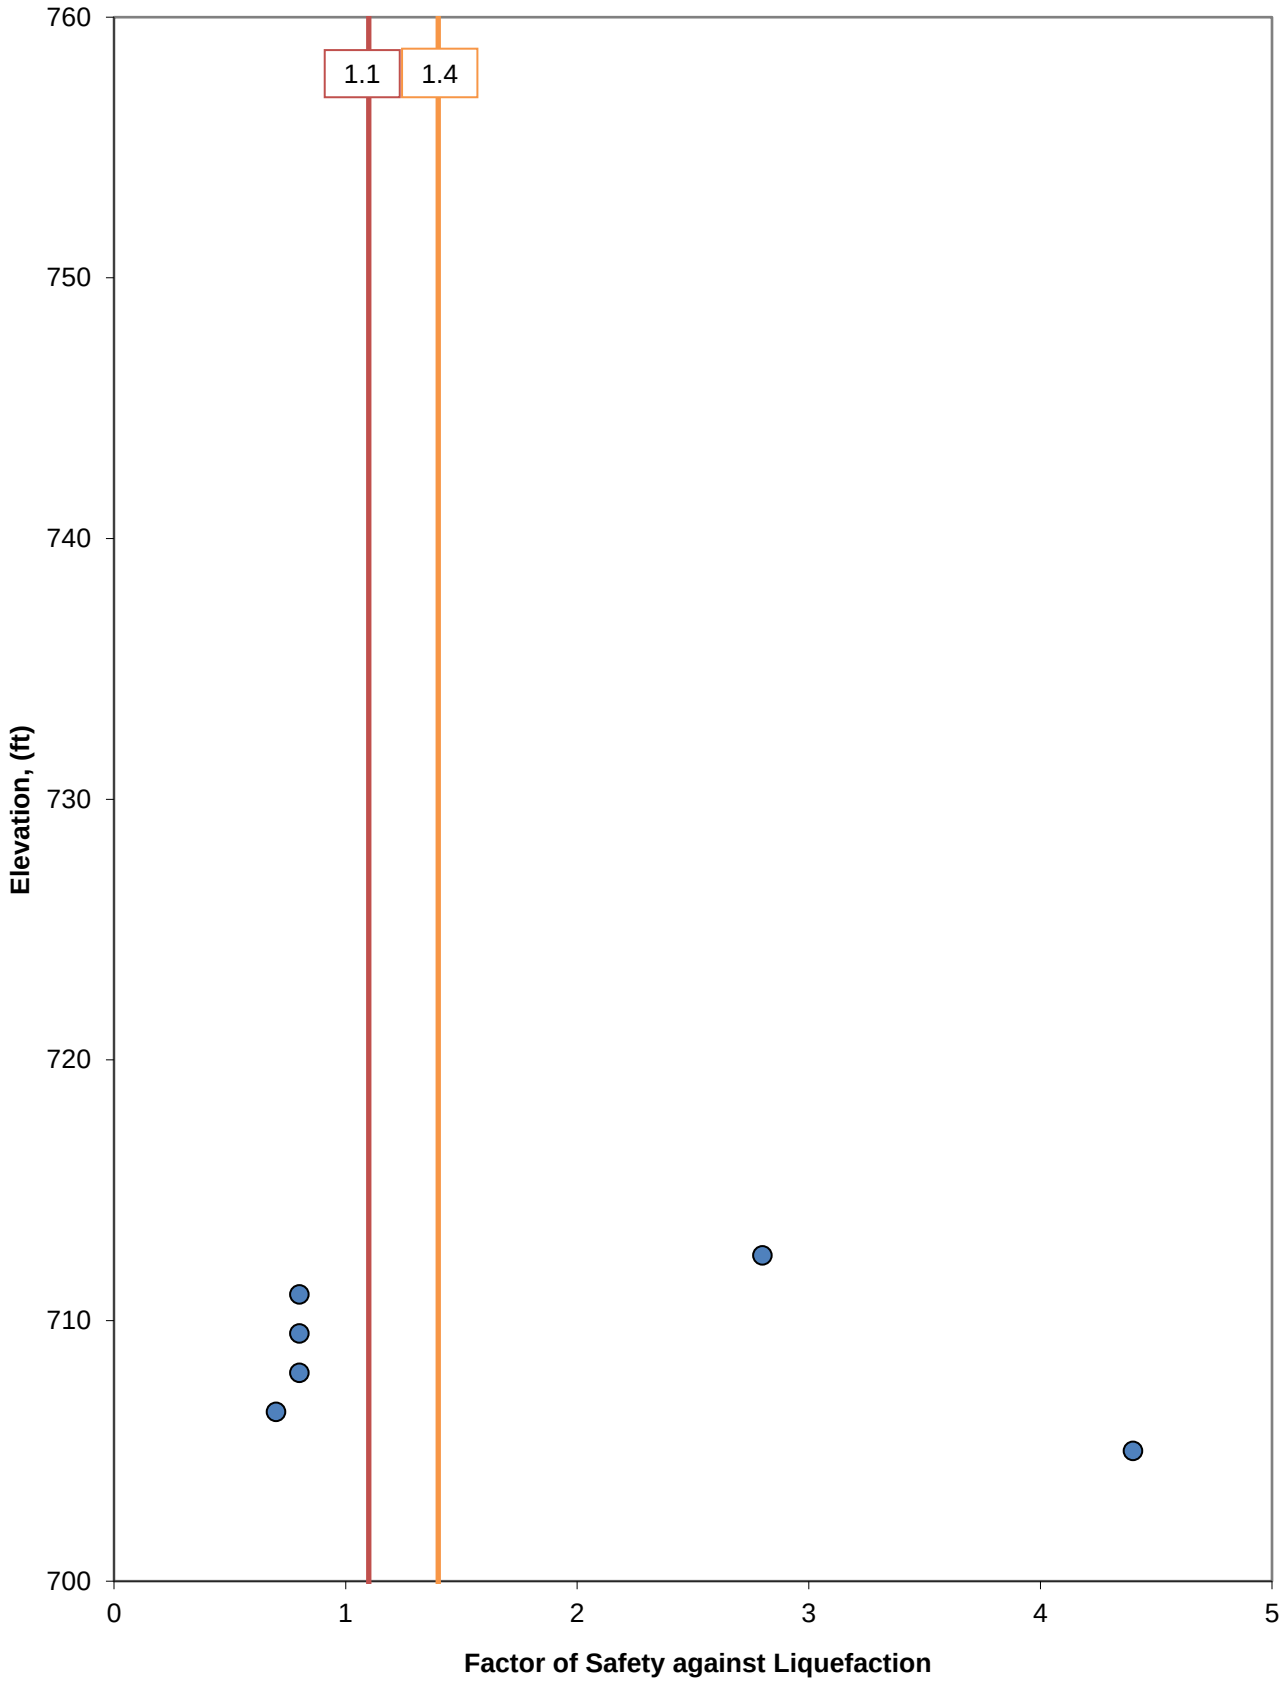
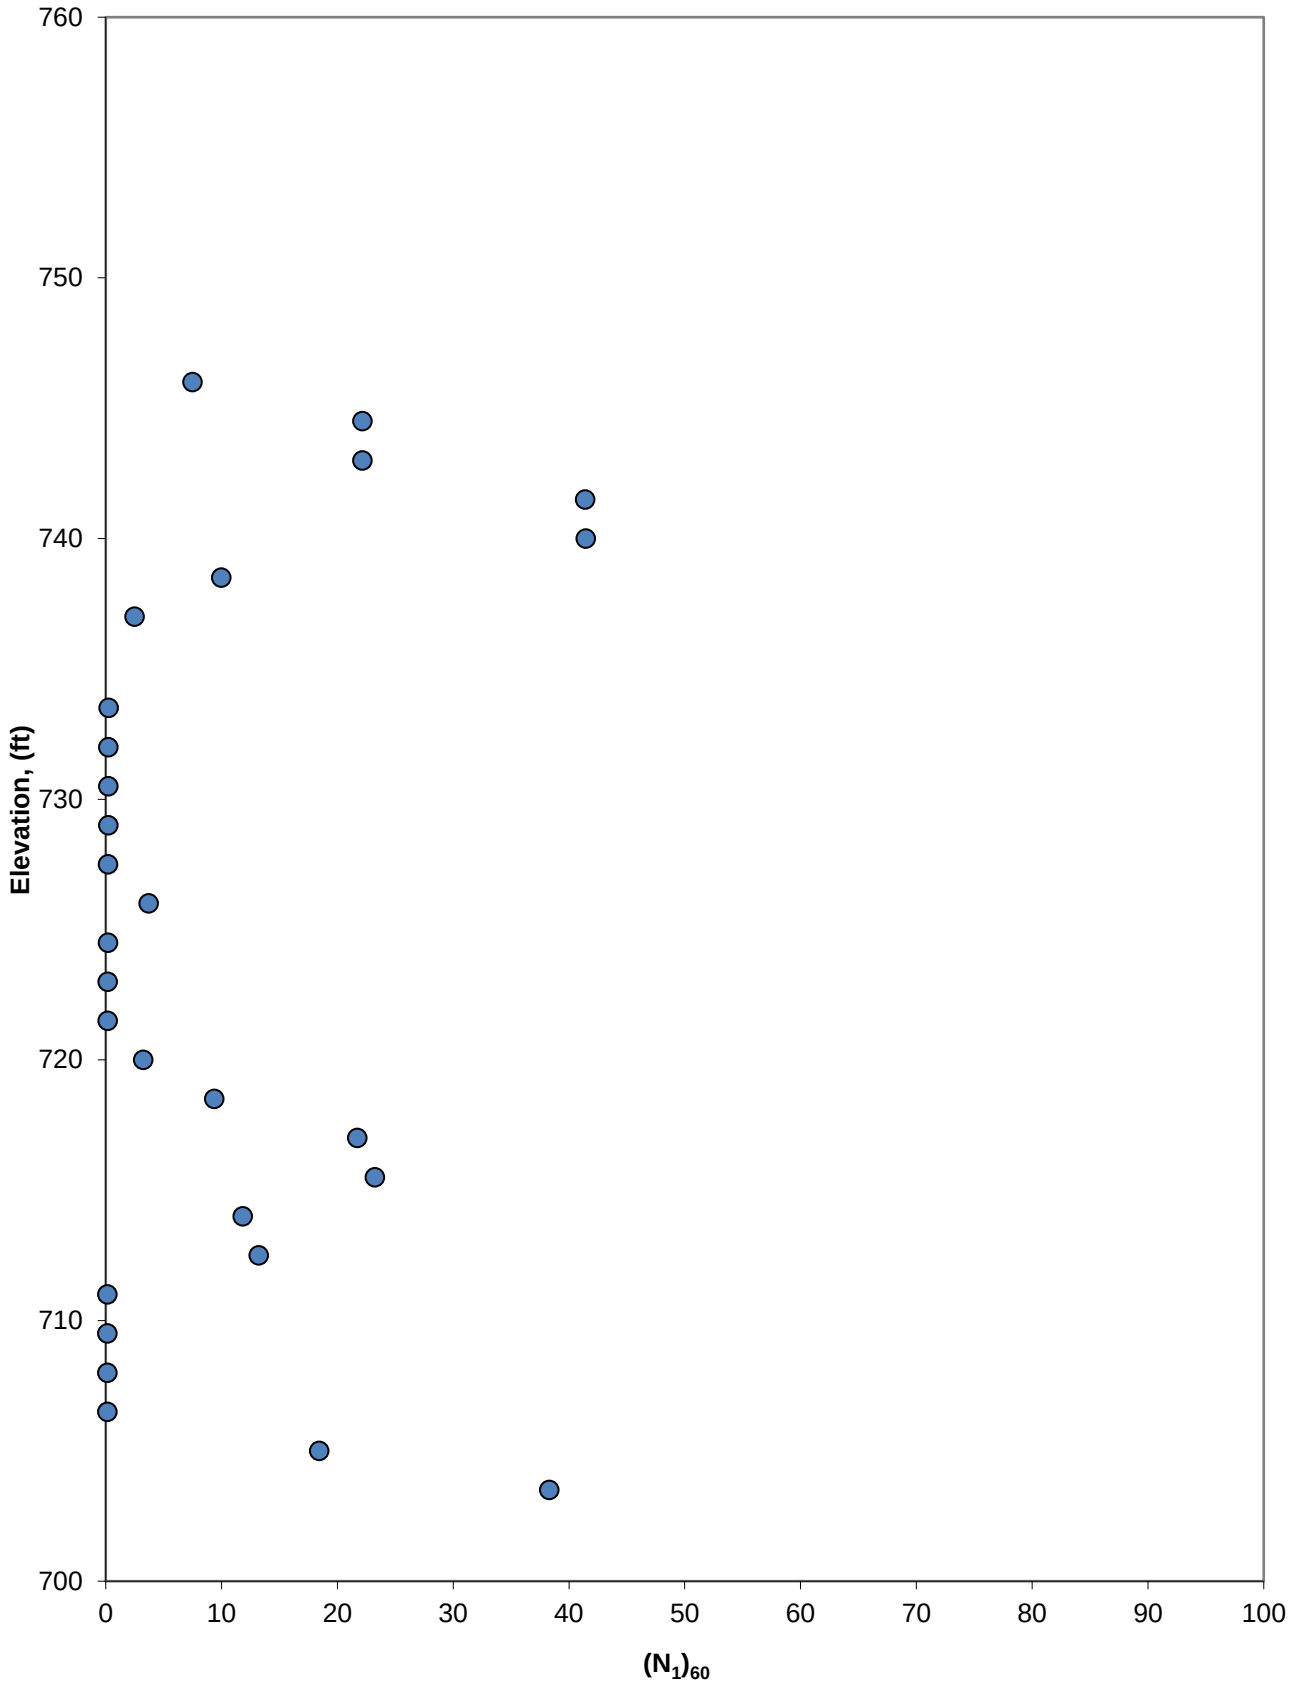
SPT Data, Simplified Stress-Based Approach



KIF TDEC Stability, Boring ID: KIF-A3, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-B1

Boring Location

Northing = 553531.6
Easting = 2439911.3

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) = 3.25 inches
Top of Hole Elevation = 759 feet
Water Depth during SPT (negative for U/S borings)= 15.5 feet
Depth Sampling Began = 0 feet
Total Unit Wt. above 1st SPT = pcf
Assumed Rod Stickup = 5 feet *(Typ assume 5ft)*
E_m Measurement based on Fv method? = 1 (1: Yes, 0: No)
SPT Sampler w/ Liners? = 0 (1: Yes, 0: No) *(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) = 14.3 feet
Final Grade Elevation during EQ = 763.1 feet
Average Total Unit Wt. of Cut/Fill = 121 pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? = 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? = 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-B1_NOR
Alpha at each sample depth known? = 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-B1
Get CSR from shear stress envelope? = 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? = (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: olishingPond, KIF-B2_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

α Curve Fit Parameters

Associated α profile: olishingPond, KIF-B3_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	2.3	feet
Final Grade Elevation during EQ	748.4	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-C1_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-C1
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

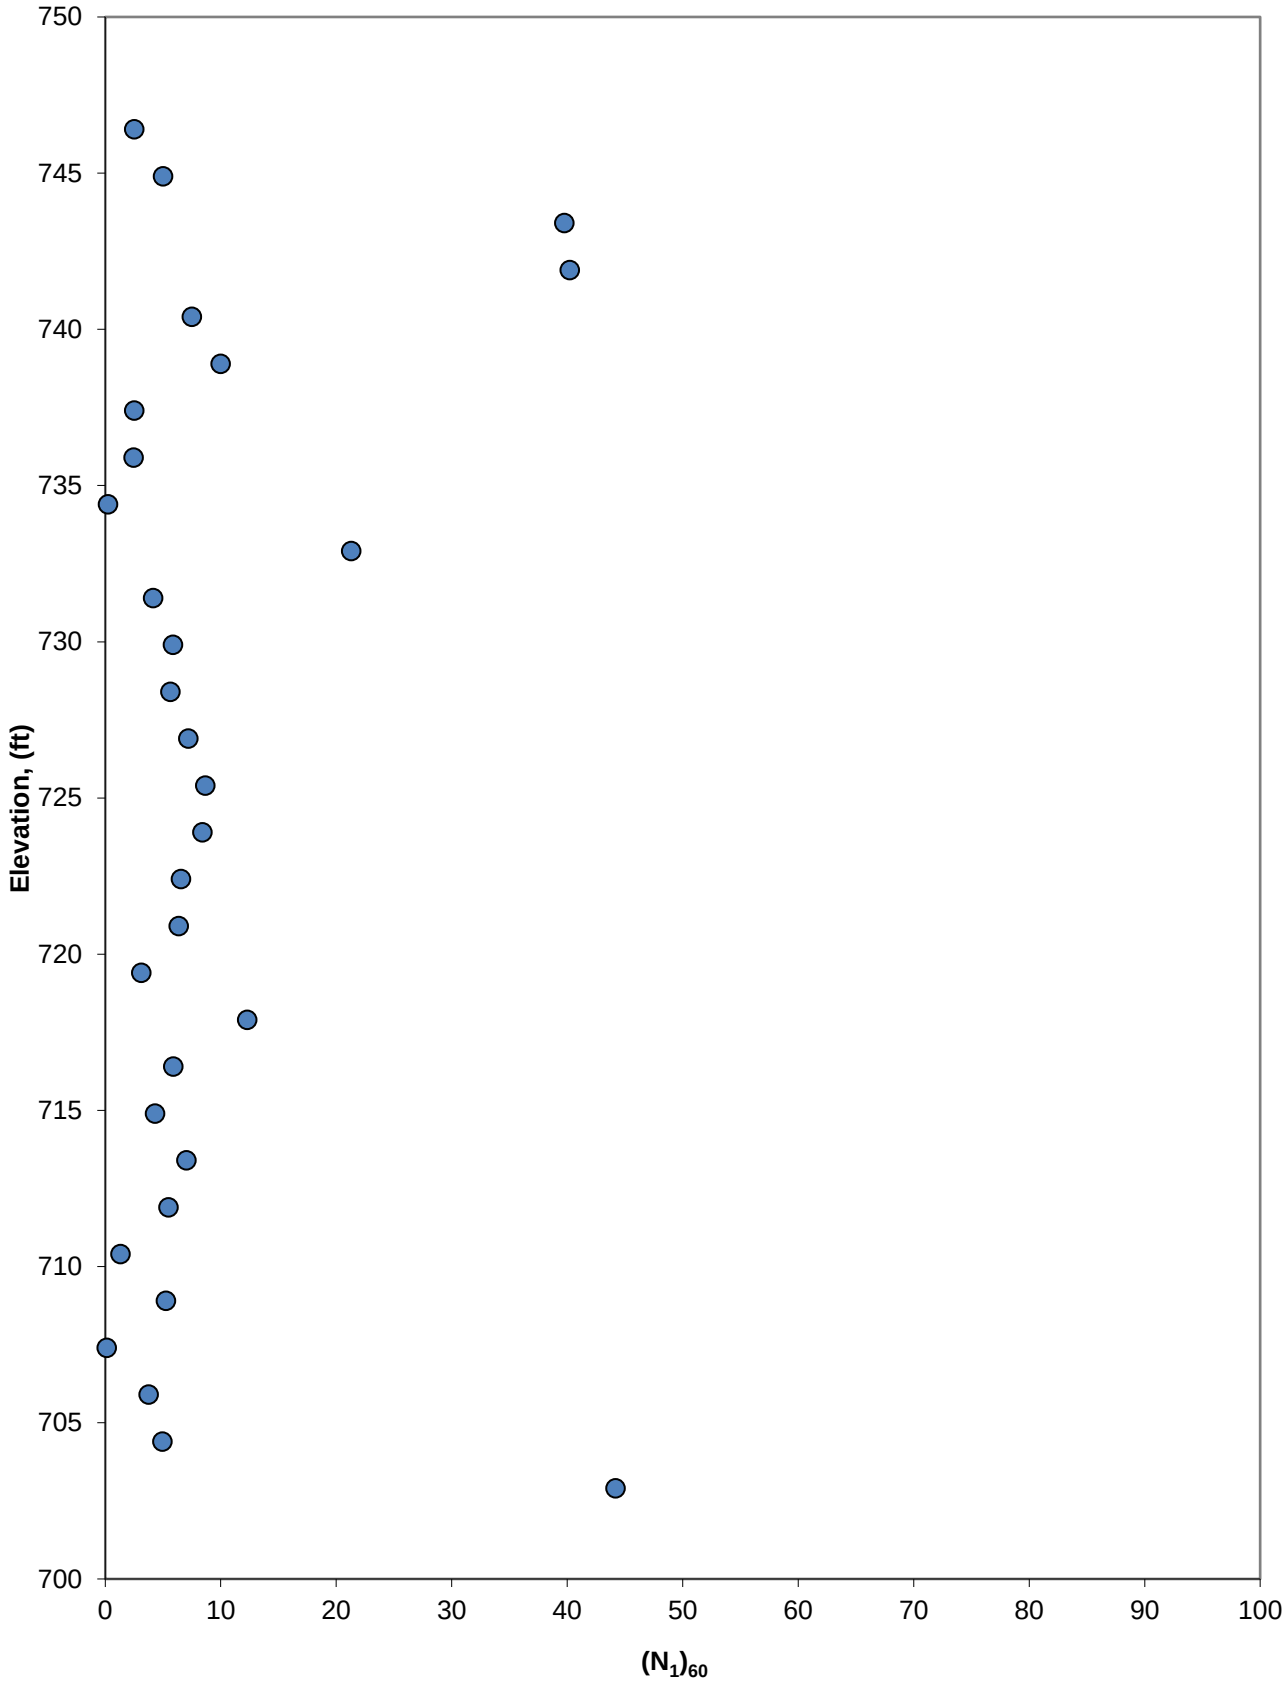
KIF TDEC Stability, Boring ID: KIF-C1, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-C2

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	743.9	feet	
Water Depth during SPT (negative for U/S borings)=	2.3	feet	
Depth Sampling Began	1.5	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	2.3	feet
Final Grade Elevation during EQ	743.9	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-C2_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-C2
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

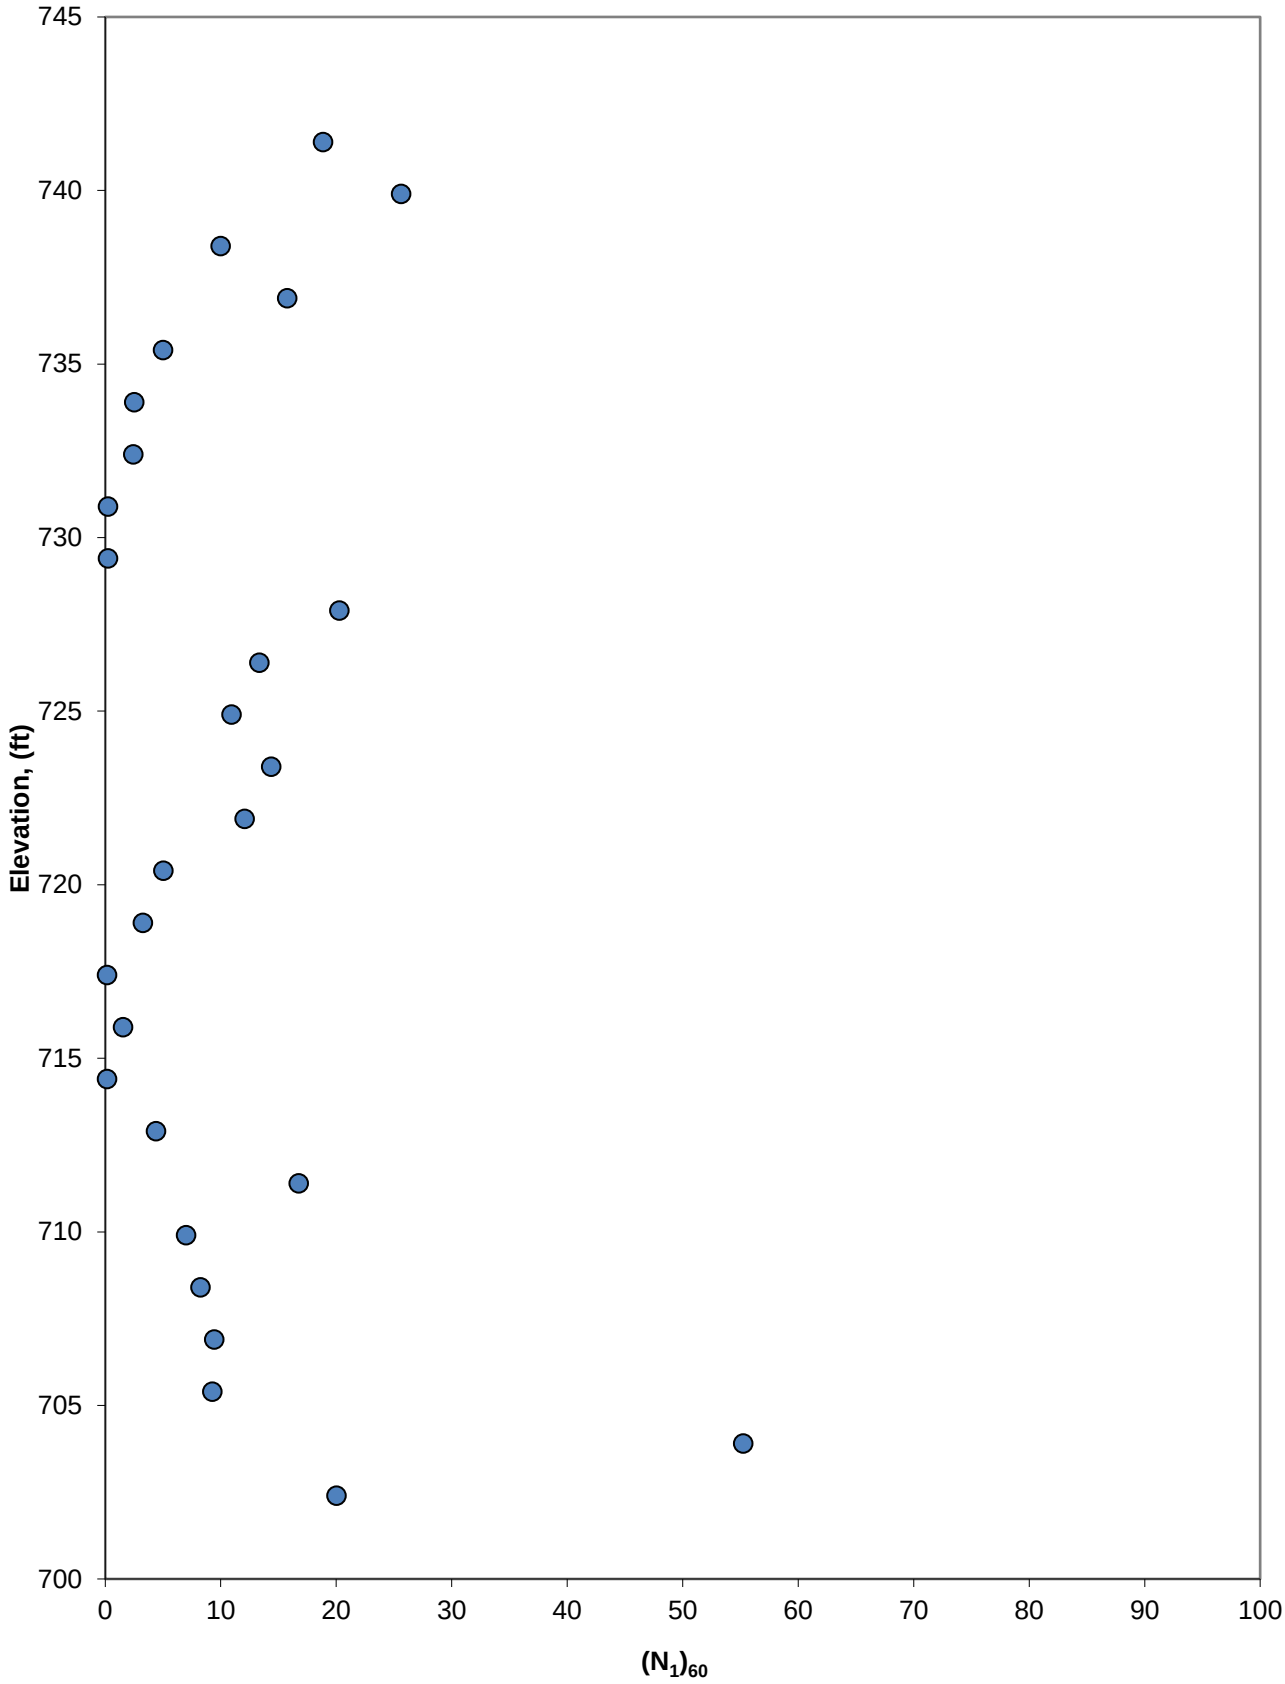
KIF TDEC Stability, Boring ID: KIF-C2, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-D1

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	748.7	feet	
Water Depth during SPT (negative for U/S borings)=	3	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	3	feet
Final Grade Elevation during EQ	748.7	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-D1_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-D1
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

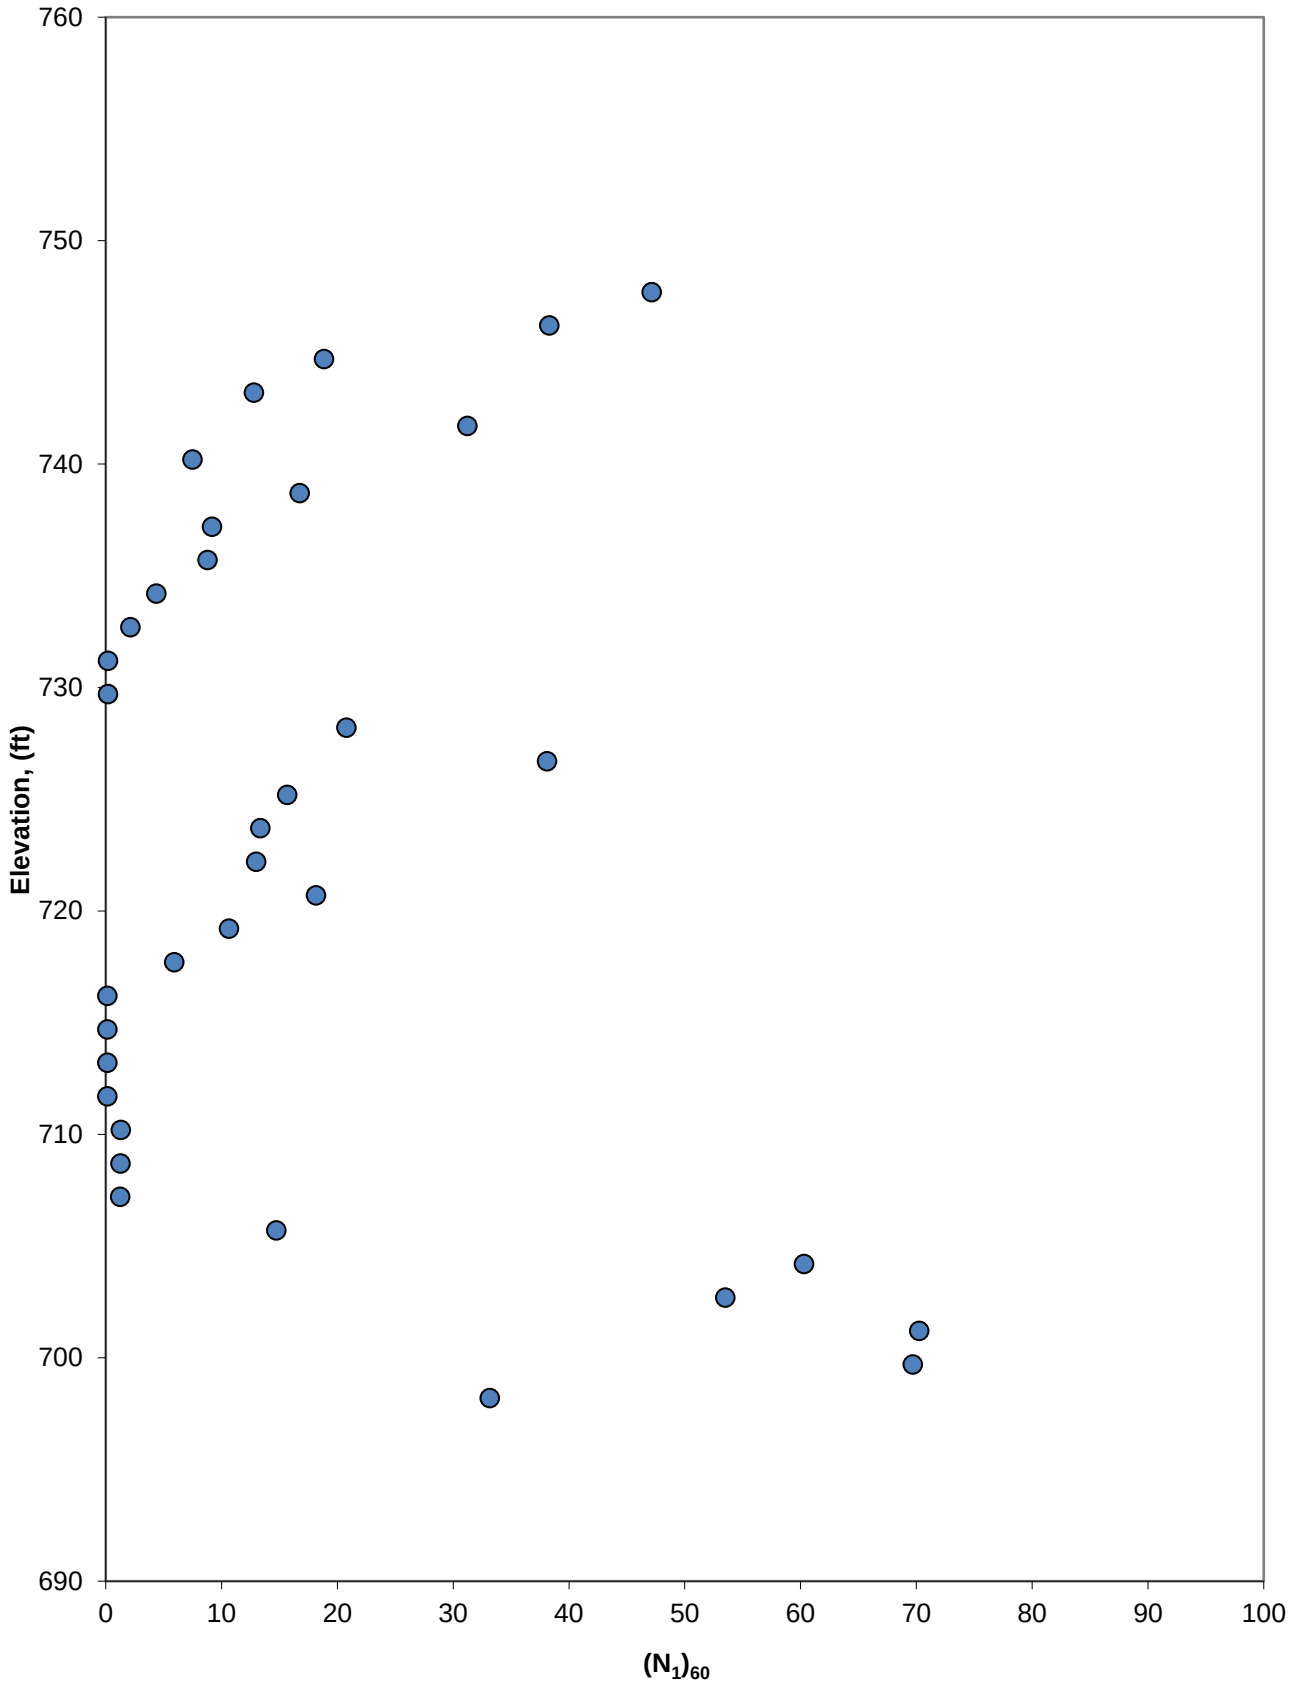
KIF TDEC Stability, Boring ID: KIF-D1, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-D2

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	743.3	feet	
Water Depth during SPT (negative for U/S borings)=	6.4	feet	
Depth Sampling Began	1	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	6.4	feet
Final Grade Elevation during EQ	743.3	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-D2_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-D2
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

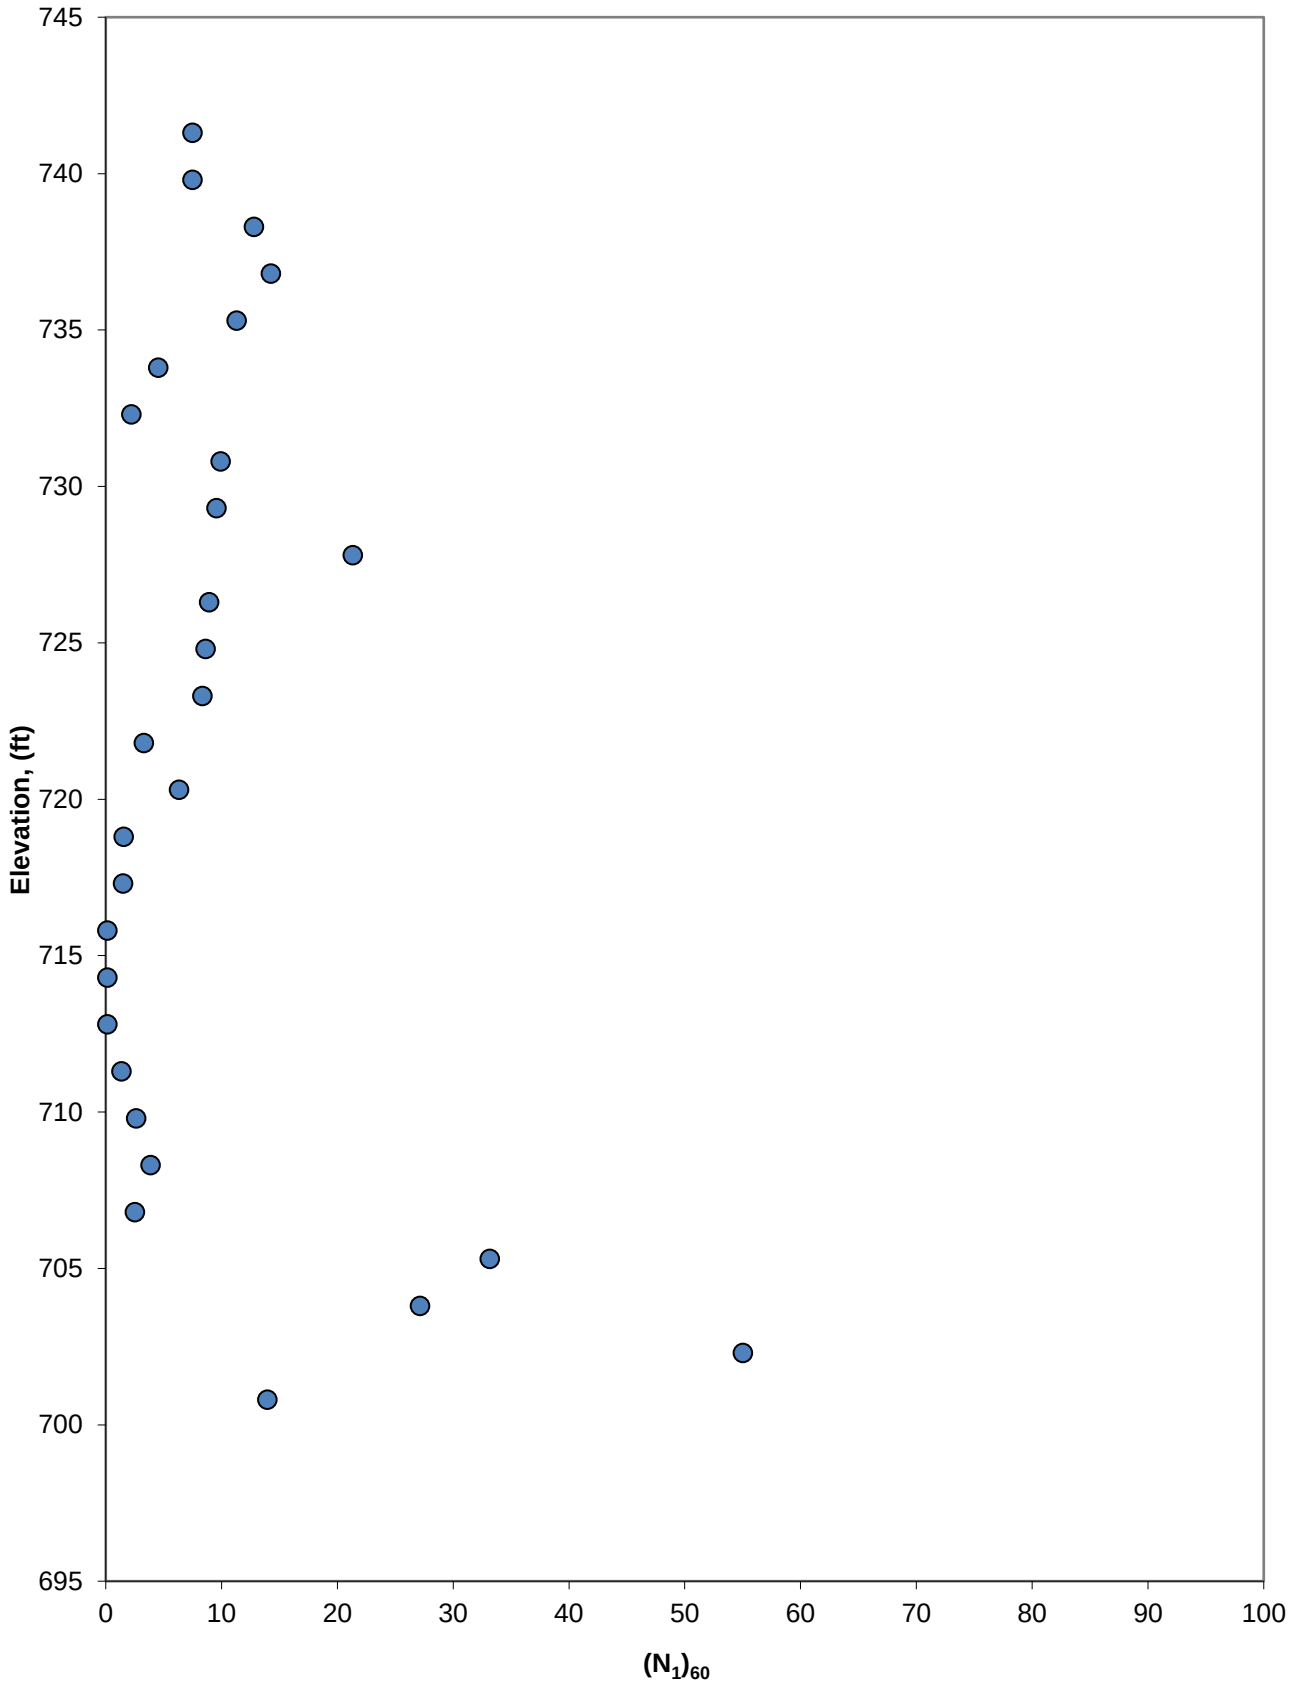
KIF TDEC Stability, Boring ID: KIF-D2, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-STN50

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	741.6	feet	
Water Depth during SPT (negative for U/S borings)=	4.6	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	4.6	feet
Final Grade Elevation during EQ	741.6	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: _Pond_Section, KIF-STN50_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: ling_Pond_Section, KIF-STN50
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

Final Grade Elevation during EQ	750.4	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: Pond_Section, KIF-STN51_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: ling_Pond_Section, KIF-STN51
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

KIF TDEC Stability, Boring ID: KIF-STN51, Source = 1 Hz, Mw = 7.6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach

3.3.2 10 Hz Design Earthquake

Project Name = KIF TDEC Seismic Stability

Boring ID = KIF-B05

Boring Location

Northing =

Easting =

OR

Baseline Station =

Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	4.625	inches	
Top of Hole Elevation	756.5	feet	
Water Depth during SPT (negative for U/S borings)=	52	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =		pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ	756.5	feet
Average Total Unit Wt. of Cut/Fill		pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-B09_NOR

Alpha at each sample depth known? 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: Alternate, KIF-B05_NOR

Get CSR from shear stress envelope? 0 (1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known? (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? = 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: lishingPond, KIF-B13_NOR

Alpha at each sample depth known? = 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

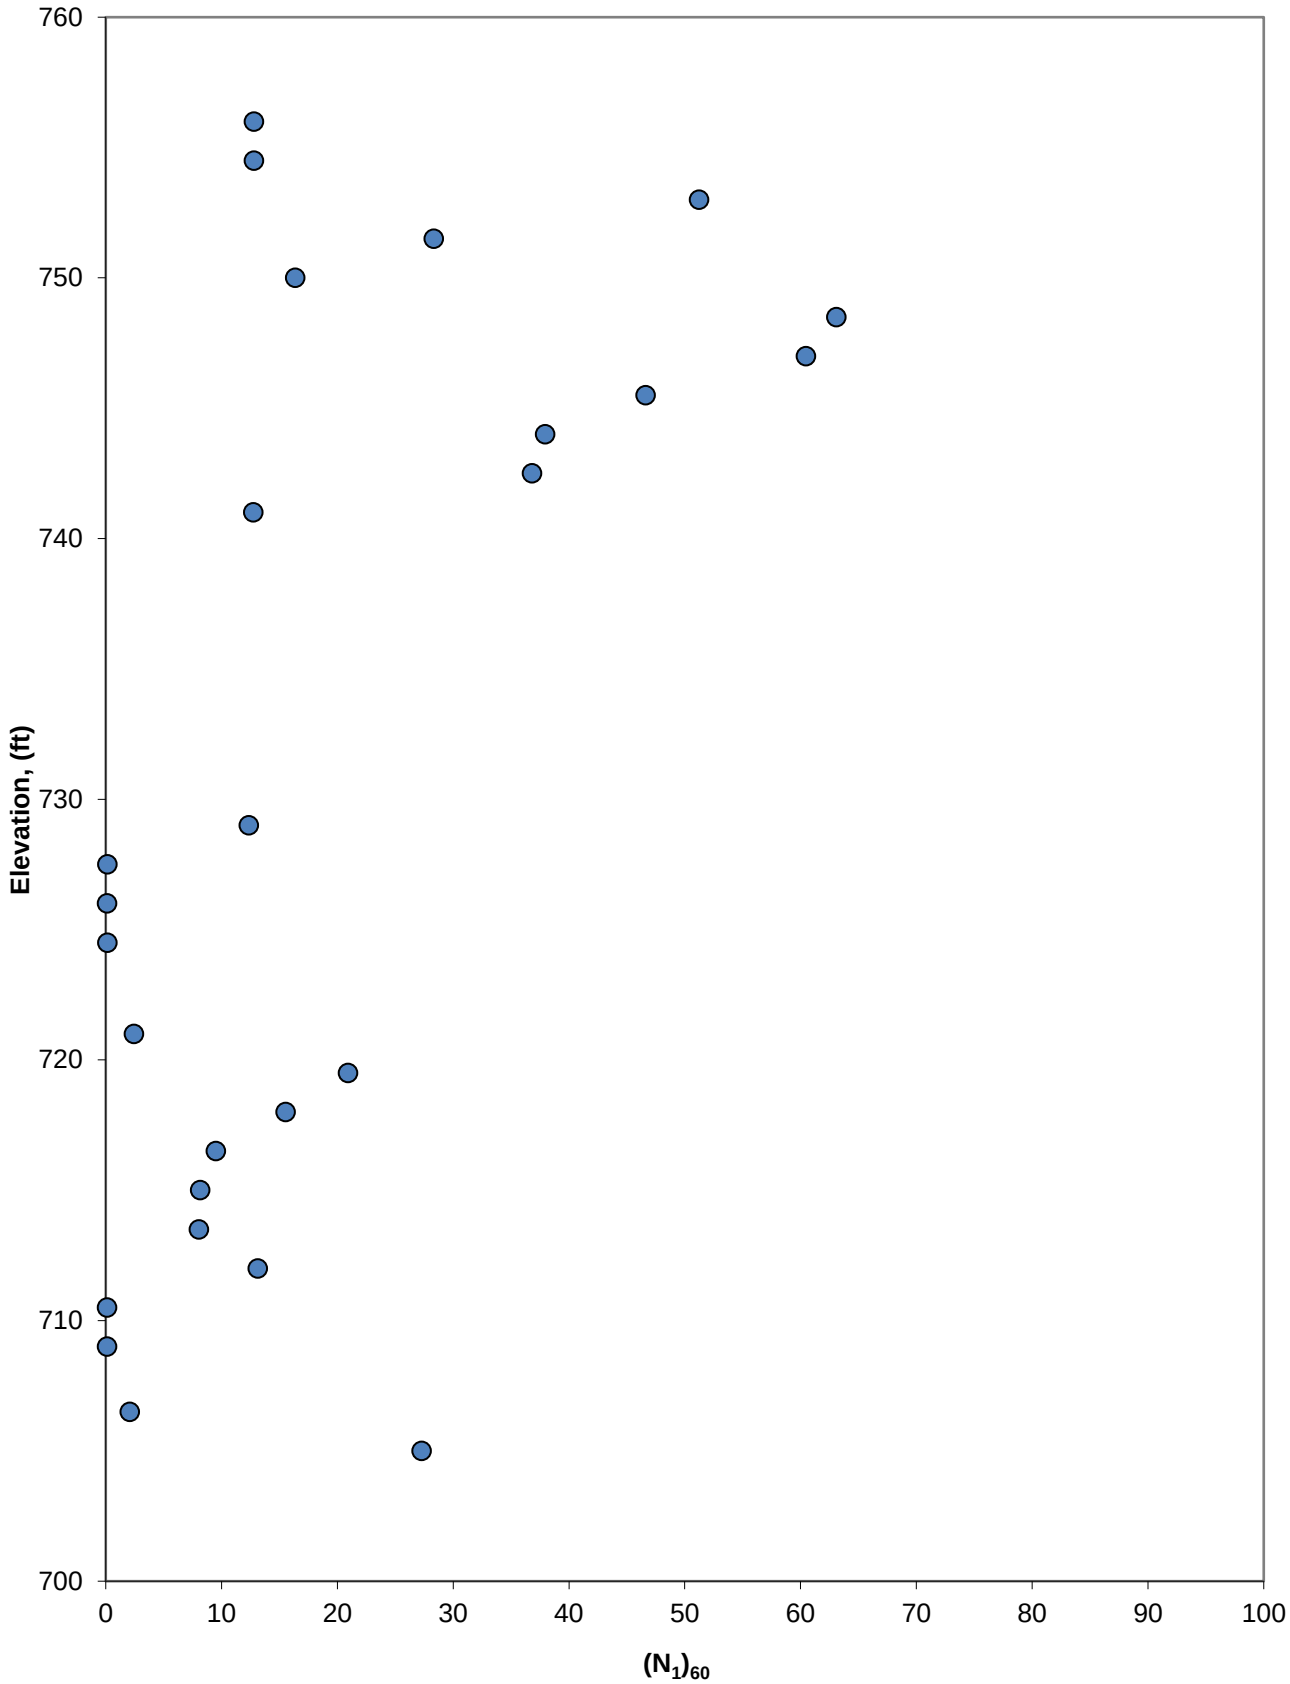
KIF TDEC Stability, Boring ID: KIF-A1, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability

Boring ID = KIF-A2

Boring Location

Northing =

Easting =

OR

Baseline Station =

Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	755	feet	
Water Depth during SPT (negative for U/S borings)=	13	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ	755.3	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-A2_NOR

Alpha at each sample depth known? 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: Section_AA, KIF-A2_NOR

Get CSR from shear stress envelope? 0 (1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known? (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

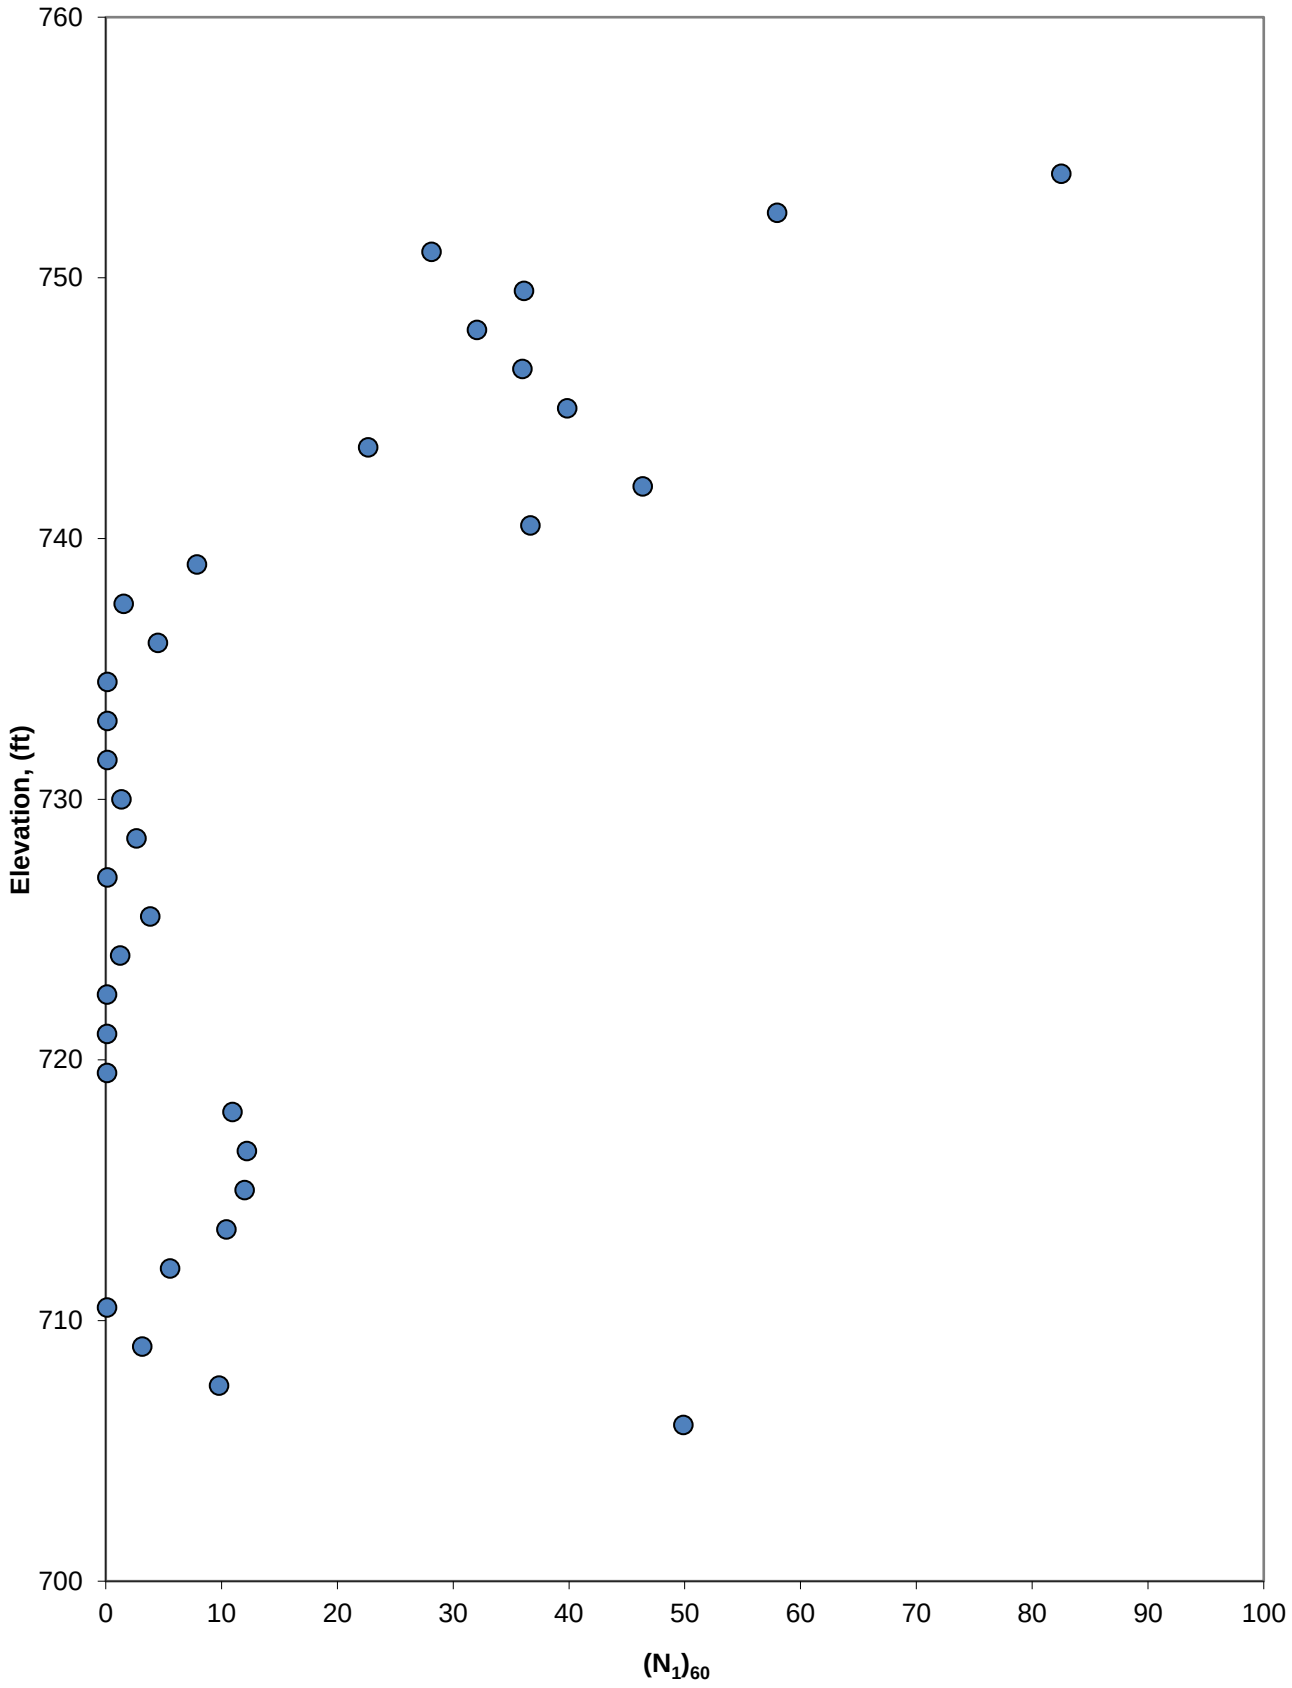
KIF TDEC Stability, Boring ID: KIF-A2, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-A3

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	747	feet	
Water Depth during SPT (negative for U/S borings)=	0	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	6	feet
Final Grade Elevation during EQ	753.3	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: SectionAA, KIF-A3_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: Section_AA, KIF-A3_NOR
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:
m3:
m2:
m1:

Earthquake Information

EQ Source (e.g., New Madrid)	10 Hz
Event (e.g., MCE, 10KEQ, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.22
EQ Mag (Mw)	6

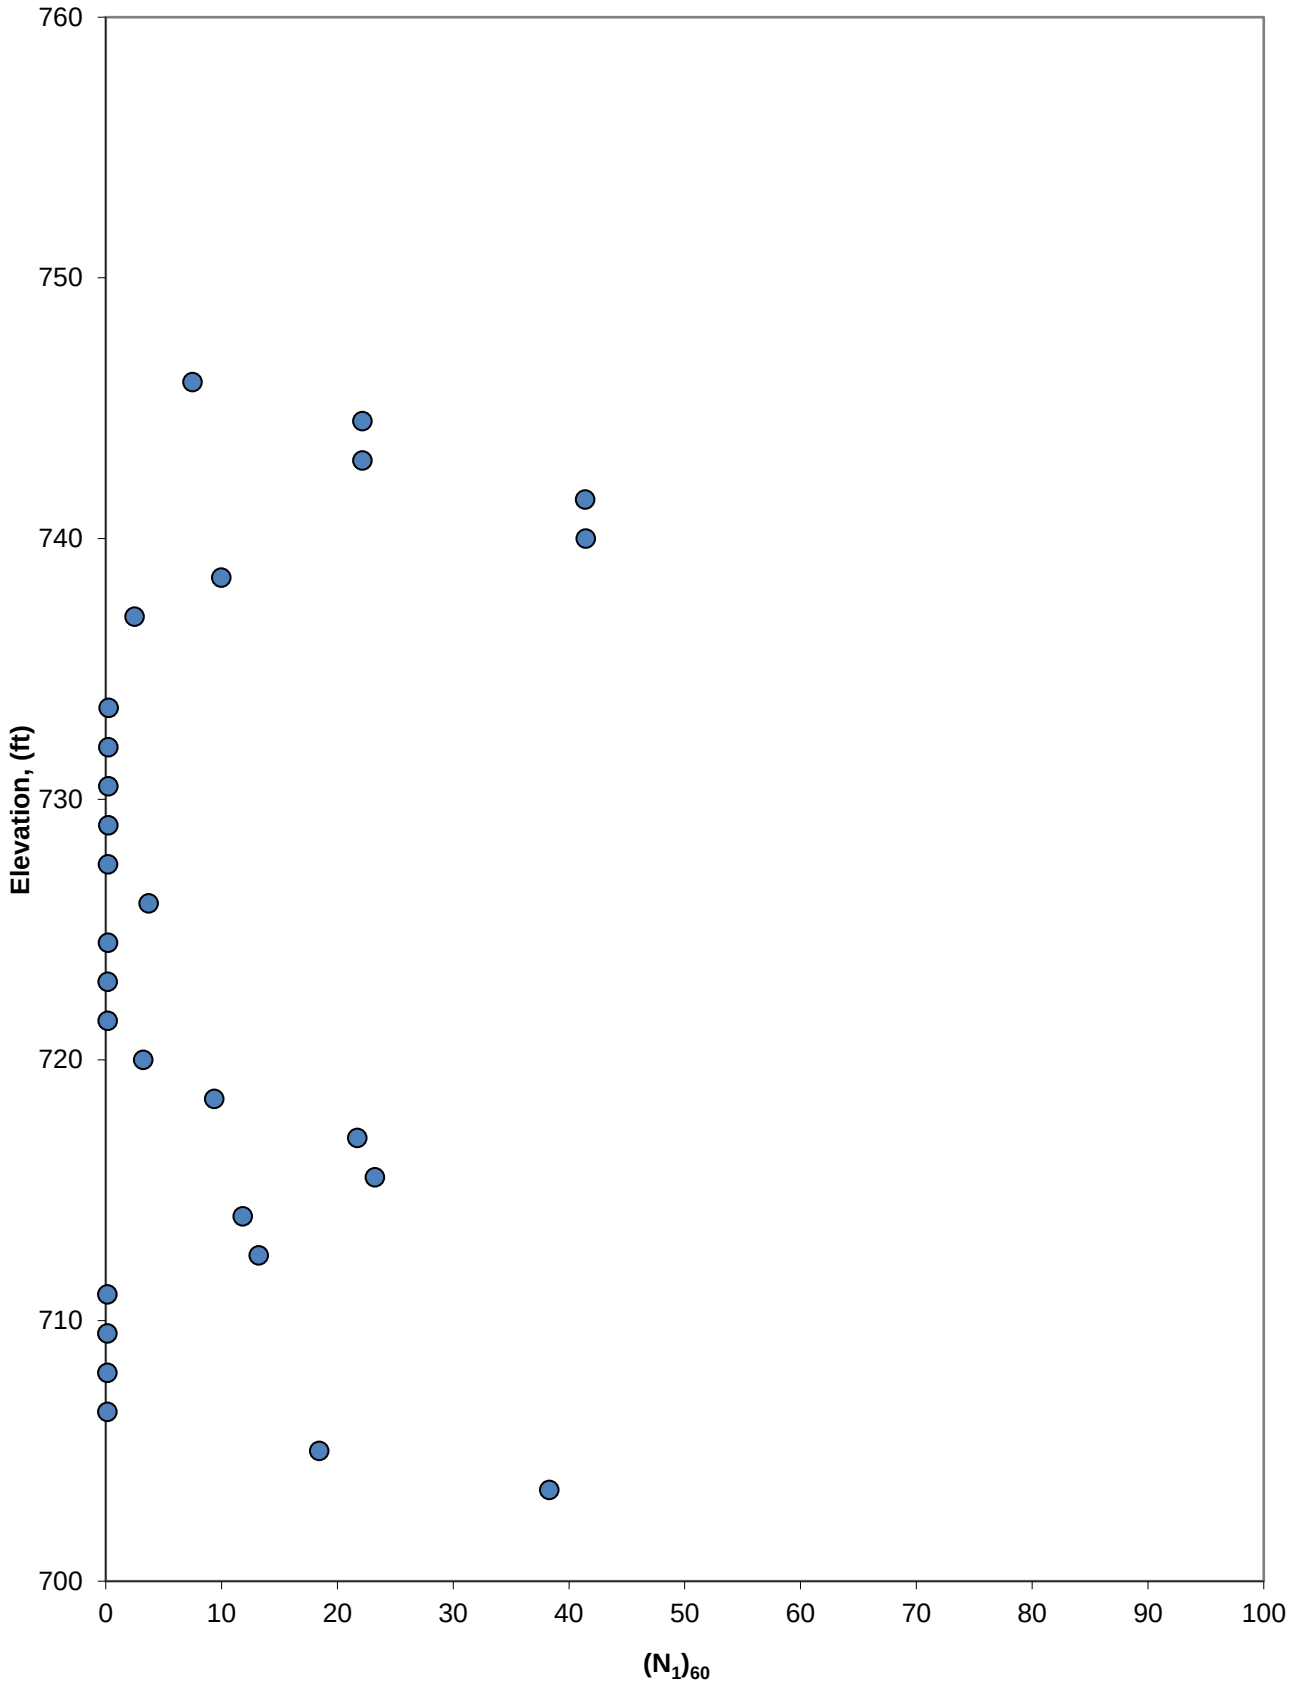
KIF TDEC Stability, Boring ID: KIF-A3, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-B1

Boring Location

Northing = 553531.6
Easting = 2439911.3

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) = 3.25 inches
Top of Hole Elevation = 759 feet
Water Depth during SPT (negative for U/S borings)= 15.5 feet
Depth Sampling Began = 0 feet
Total Unit Wt. above 1st SPT = pcf
Assumed Rod Stickup = 5 feet *(Typ assume 5ft)*
E_m Measurement based on Fv method? = 1 (1: Yes, 0: No)
SPT Sampler w/ Liners? = 0 (1: Yes, 0: No) *(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) = 14.3 feet
Final Grade Elevation during EQ = 763.1 feet
Average Total Unit Wt. of Cut/Fill = 121 pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? = 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? = 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-B1_NOR
Alpha at each sample depth known? = 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-B1
Get CSR from shear stress envelope? = 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	753.02	feet	
Water Depth during SPT (negative for U/S borings)=	15.5	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	4.6	feet
Final Grade Elevation during EQ	752.2	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: olishingPond, KIF-B2_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: olishing_Pond, KIF-B2_NOR
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	8.9	feet
Final Grade Elevation during EQ	750.5	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: olishingPond, KIF-B3_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

KIF TDEC Stability, Boring ID: KIF-BF-SPT5, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach

Project Name = KIF TDEC Stability
Boring ID = KIF-C1

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	748.4	feet	
Water Depth during SPT (negative for U/S borings)=	2.3	feet	
Depth Sampling Began	1	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	2.3	feet
Final Grade Elevation during EQ	748.4	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-C1_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-C1
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

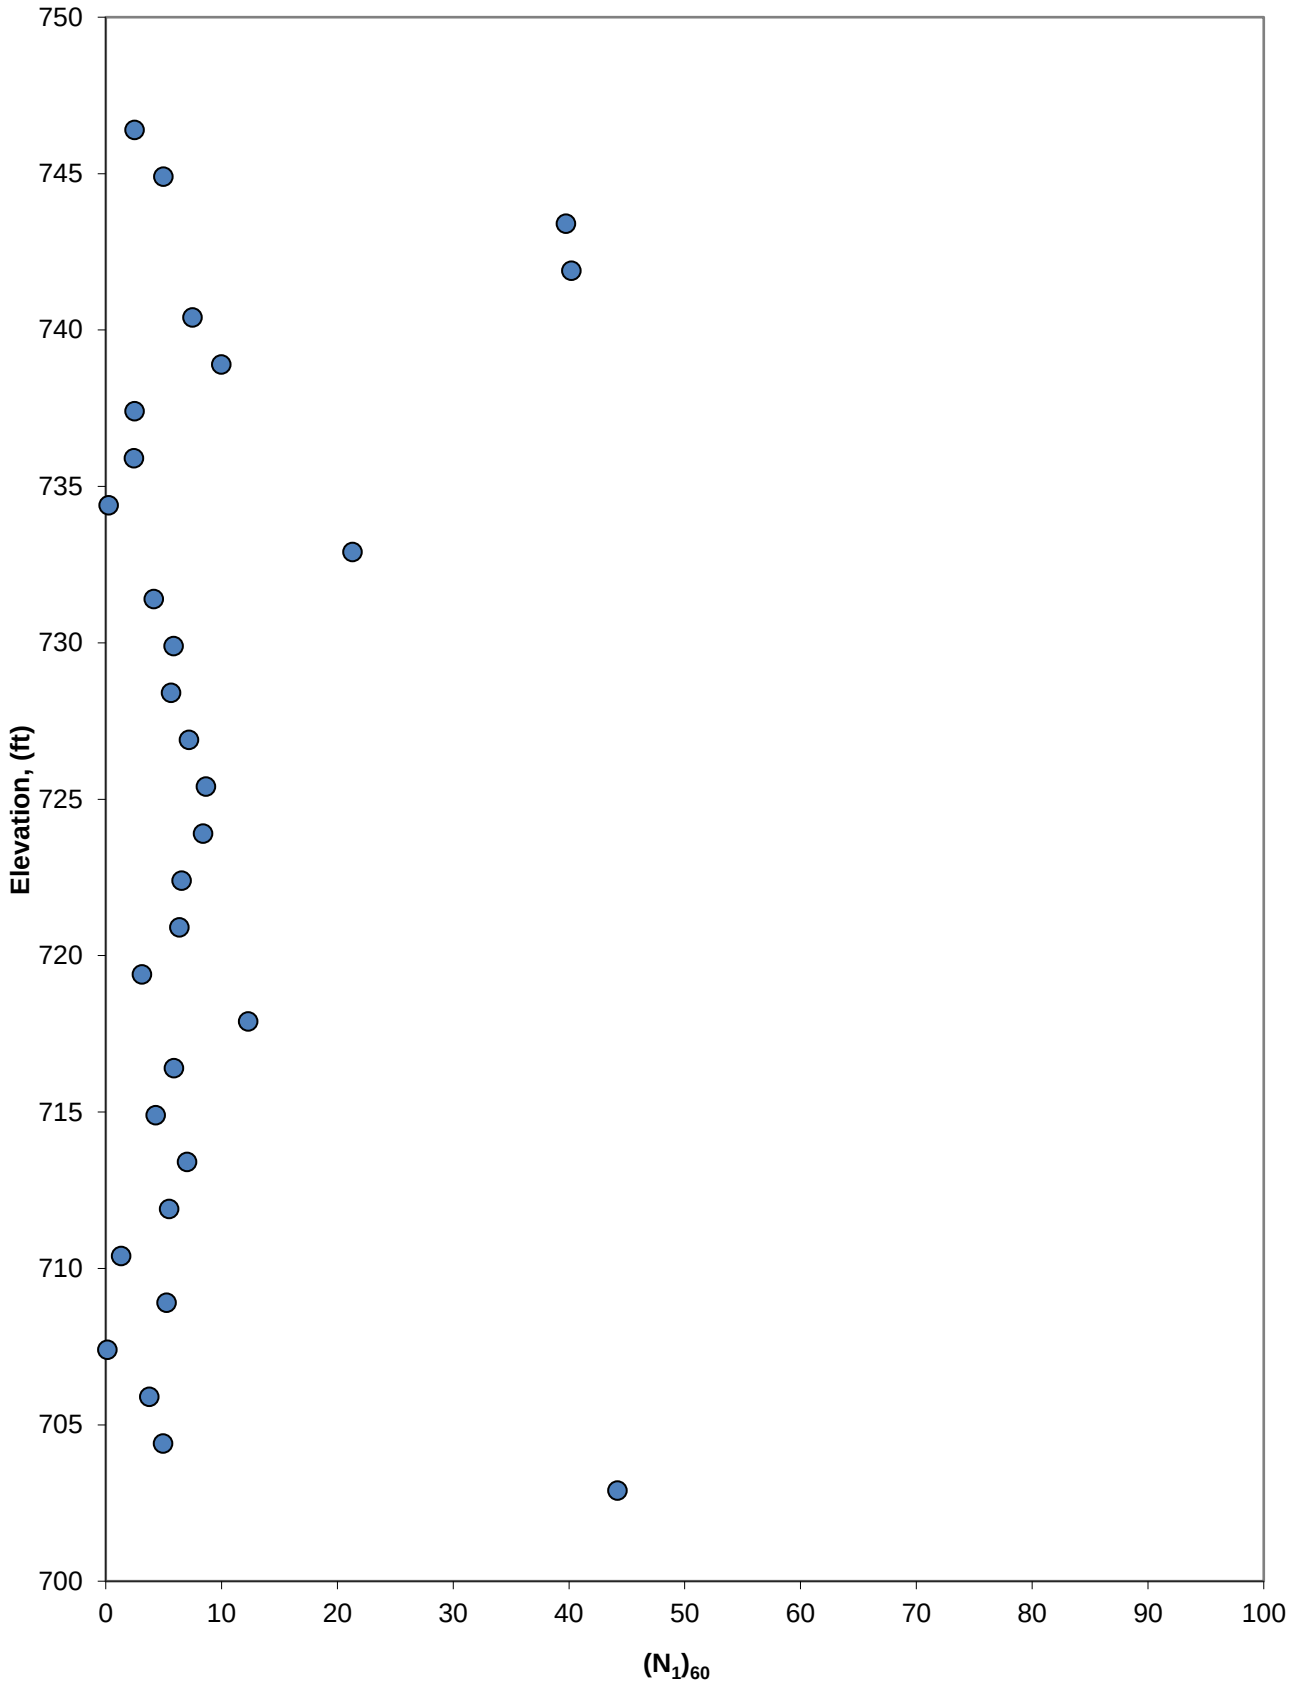
KIF TDEC Stability, Boring ID: KIF-C1, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-C2

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	743.9	feet	
Water Depth during SPT (negative for U/S borings)=	2.3	feet	
Depth Sampling Began	1.5	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	2.3	feet
Final Grade Elevation during EQ	743.9	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-C2_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-C2
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

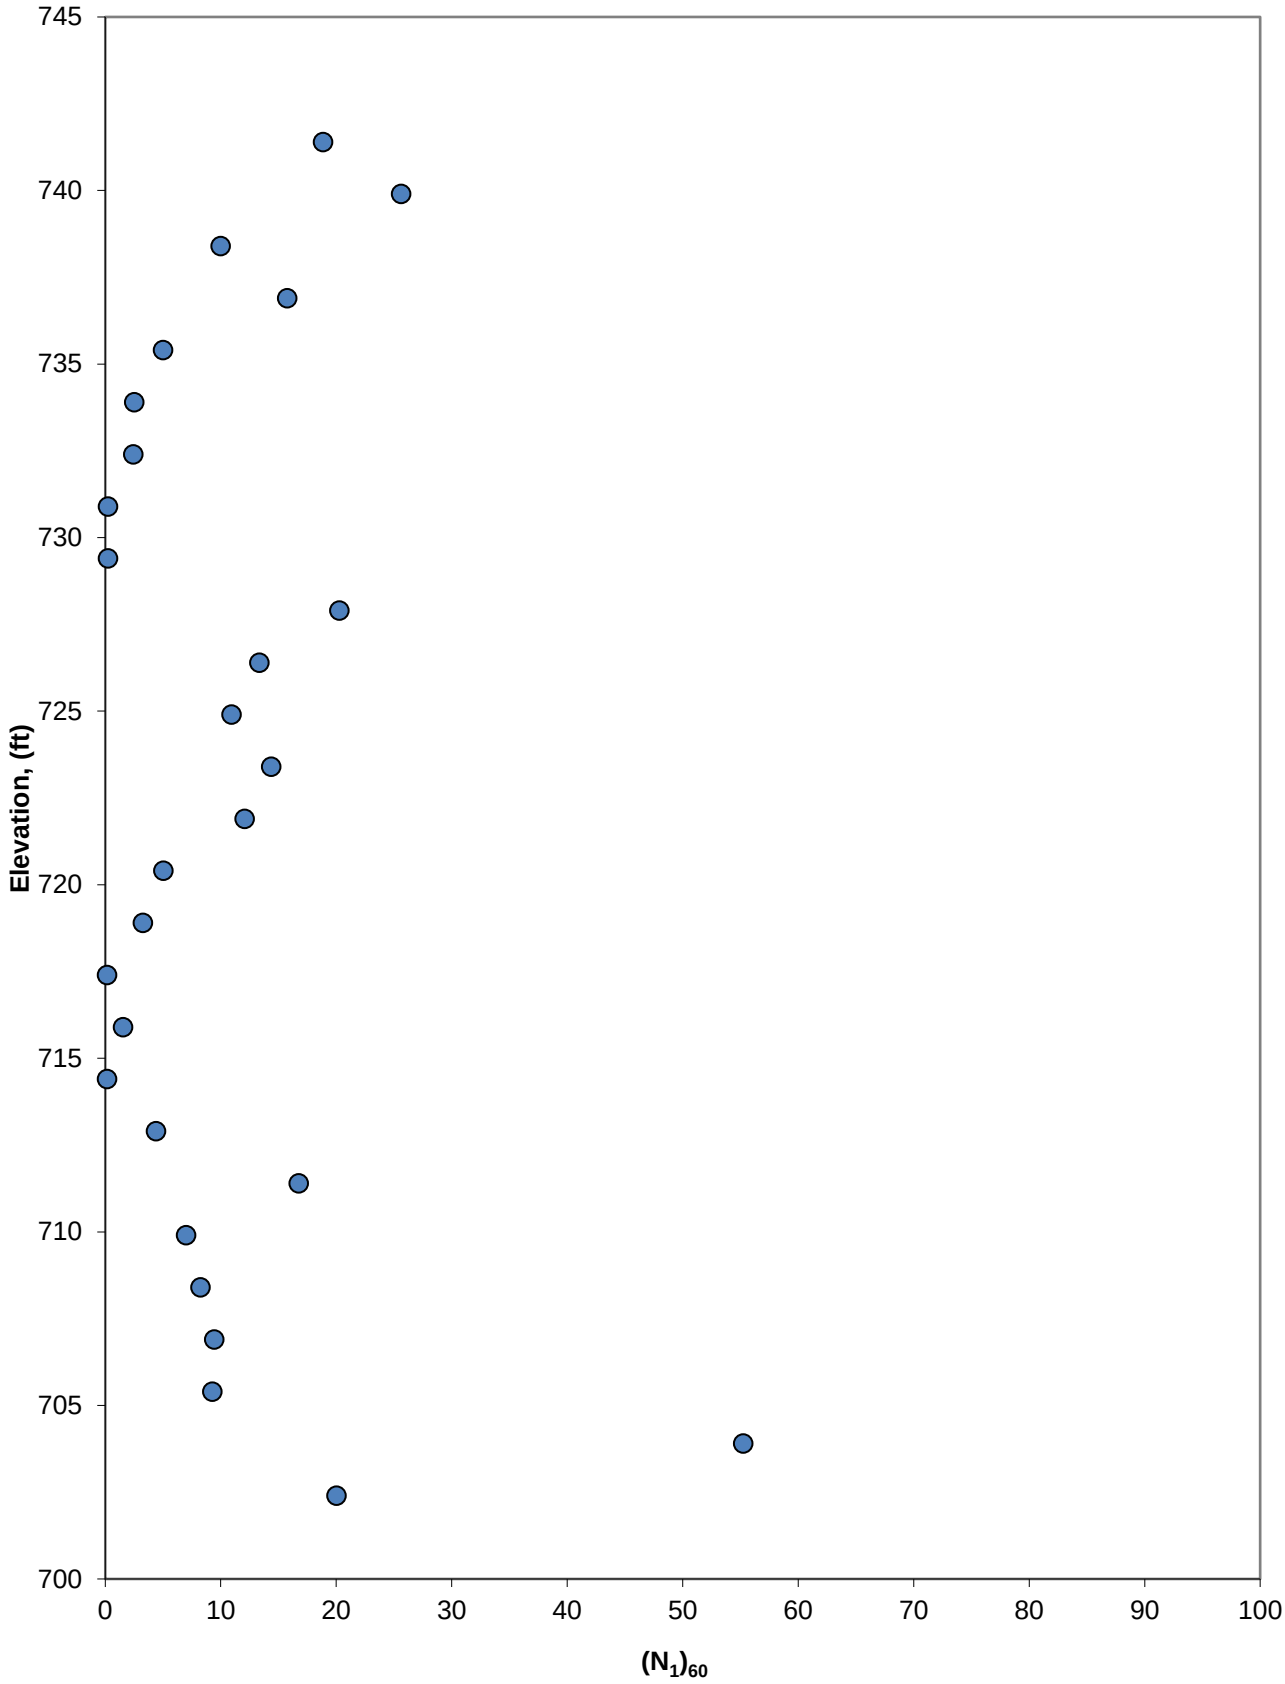
KIF TDEC Stability, Boring ID: KIF-C2, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-D1

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	748.7	feet	
Water Depth during SPT (negative for U/S borings)=	3	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	3	feet
Final Grade Elevation during EQ	748.7	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-D1_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-D1
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

Project Name = KIF TDEC Stability
Boring ID = KIF-D2

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	743.3	feet	
Water Depth during SPT (negative for U/S borings)=	6.4	feet	
Depth Sampling Began	1	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	6.4	feet
Final Grade Elevation during EQ	743.3	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: ng_Pond_Section, KIF-D2_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: shing_Pond_Section, KIF-D2
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

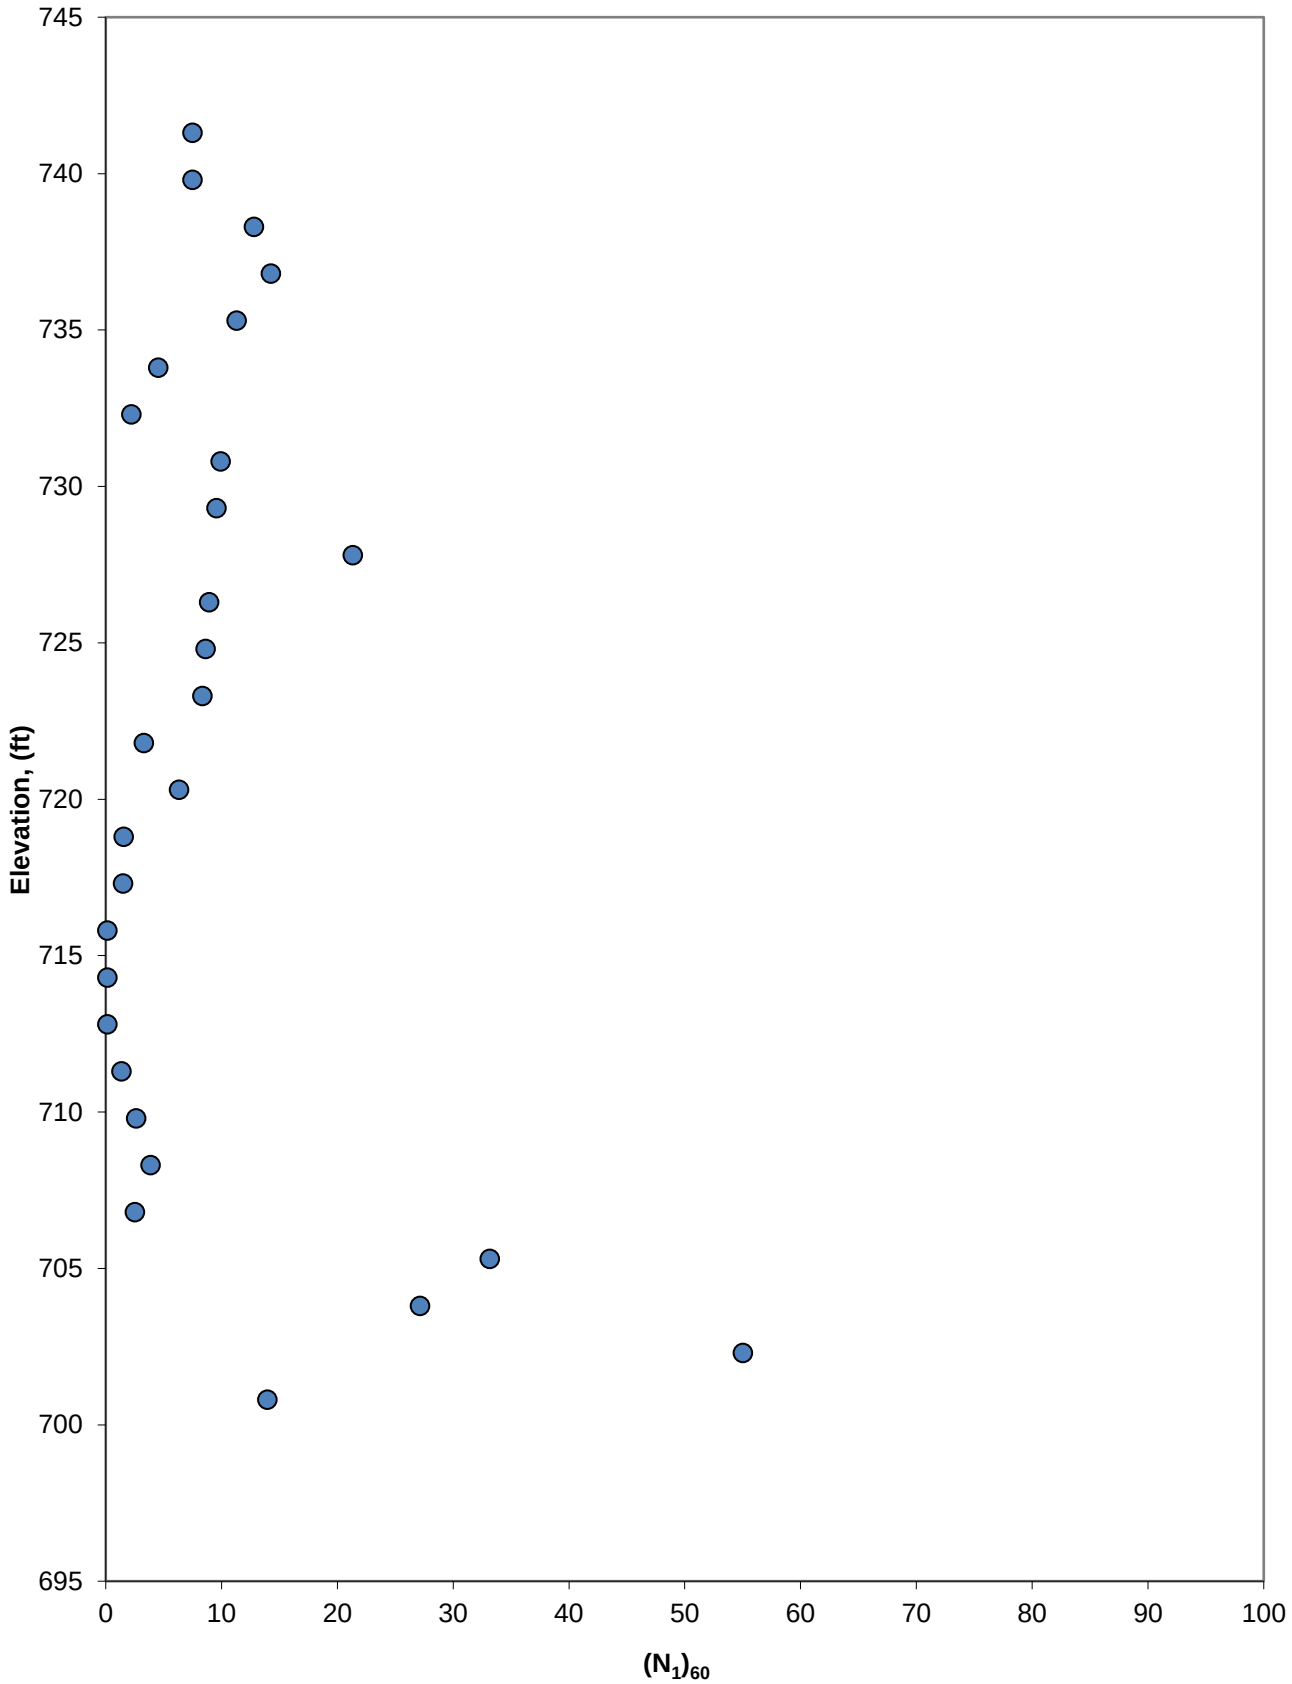
KIF TDEC Stability, Boring ID: KIF-D2, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



Project Name = KIF TDEC Stability
Boring ID = KIF-STN50

Boring Location

Northing =
Easting =

OR

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches	
Top of Hole Elevation	741.6	feet	
Water Depth during SPT (negative for U/S borings)=	4.6	feet	
Depth Sampling Began	0	feet	
Total Unit Wt. above 1st SPT =	120	pcf	
Assumed Rod Stickup =	5	feet	*(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)	
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No)	*(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	4.6	feet
Final Grade Elevation during EQ	741.6	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: _Pond_Section, KIF-STN50_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: ling_Pond_Section, KIF-STN50
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known? (1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

Baseline Station =
Offset (+ Right) =

Drilling Information

Boring Inner Diameter (ID) =	3.25	inches
Top of Hole Elevation	750.4	feet
Water Depth during SPT (negative for U/S borings)=	-1	feet
Depth Sampling Began	0	feet
Total Unit Wt. above 1st SPT =	120	pcf
Assumed Rod Stickup =	5	feet *(Typ assume 5ft)*
E_m Measurement based on Fv method? =	1	(1: Yes, 0: No)
SPT Sampler w/ Liners? =	0	(1: Yes, 0: No) *(Typ. no)*

During EQ Information

Water Depth during EQ (relative to SPT TOH, negative for U/S borings) =	-1	feet
Final Grade Elevation during EQ	750.4	feet
Average Total Unit Wt. of Cut/Fill	120	pcf

Fines Content Correction

Fines content correction for samples with blow counts of zero? 1 (1: Yes, 0: No)

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile? 0 (1: Yes, 0: No)
If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile: Pond_Section, KIF-STN51_NOR
Alpha at each sample depth known? 1 (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:
m3:
m2:
m1:
m0:

Associated ground response profile: ling_Pond_Section, KIF-STN51
Get CSR from shear stress envelope? 0 (1: Yes, 0: No)
If previous answer is No, then CSR will be calculated using a_{max} and r_d
Max. Shear Stress at each sample depth known? (1: Yes, 0: No)
If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

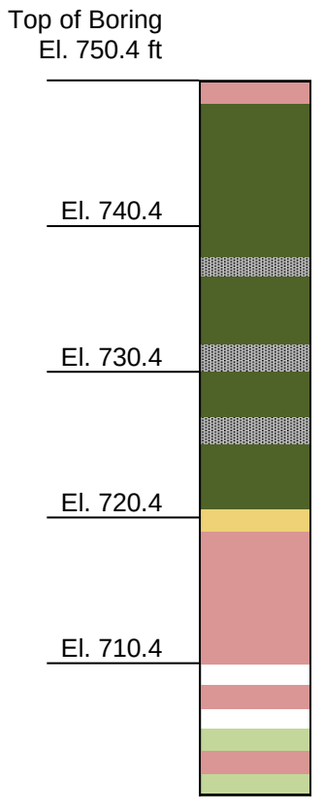
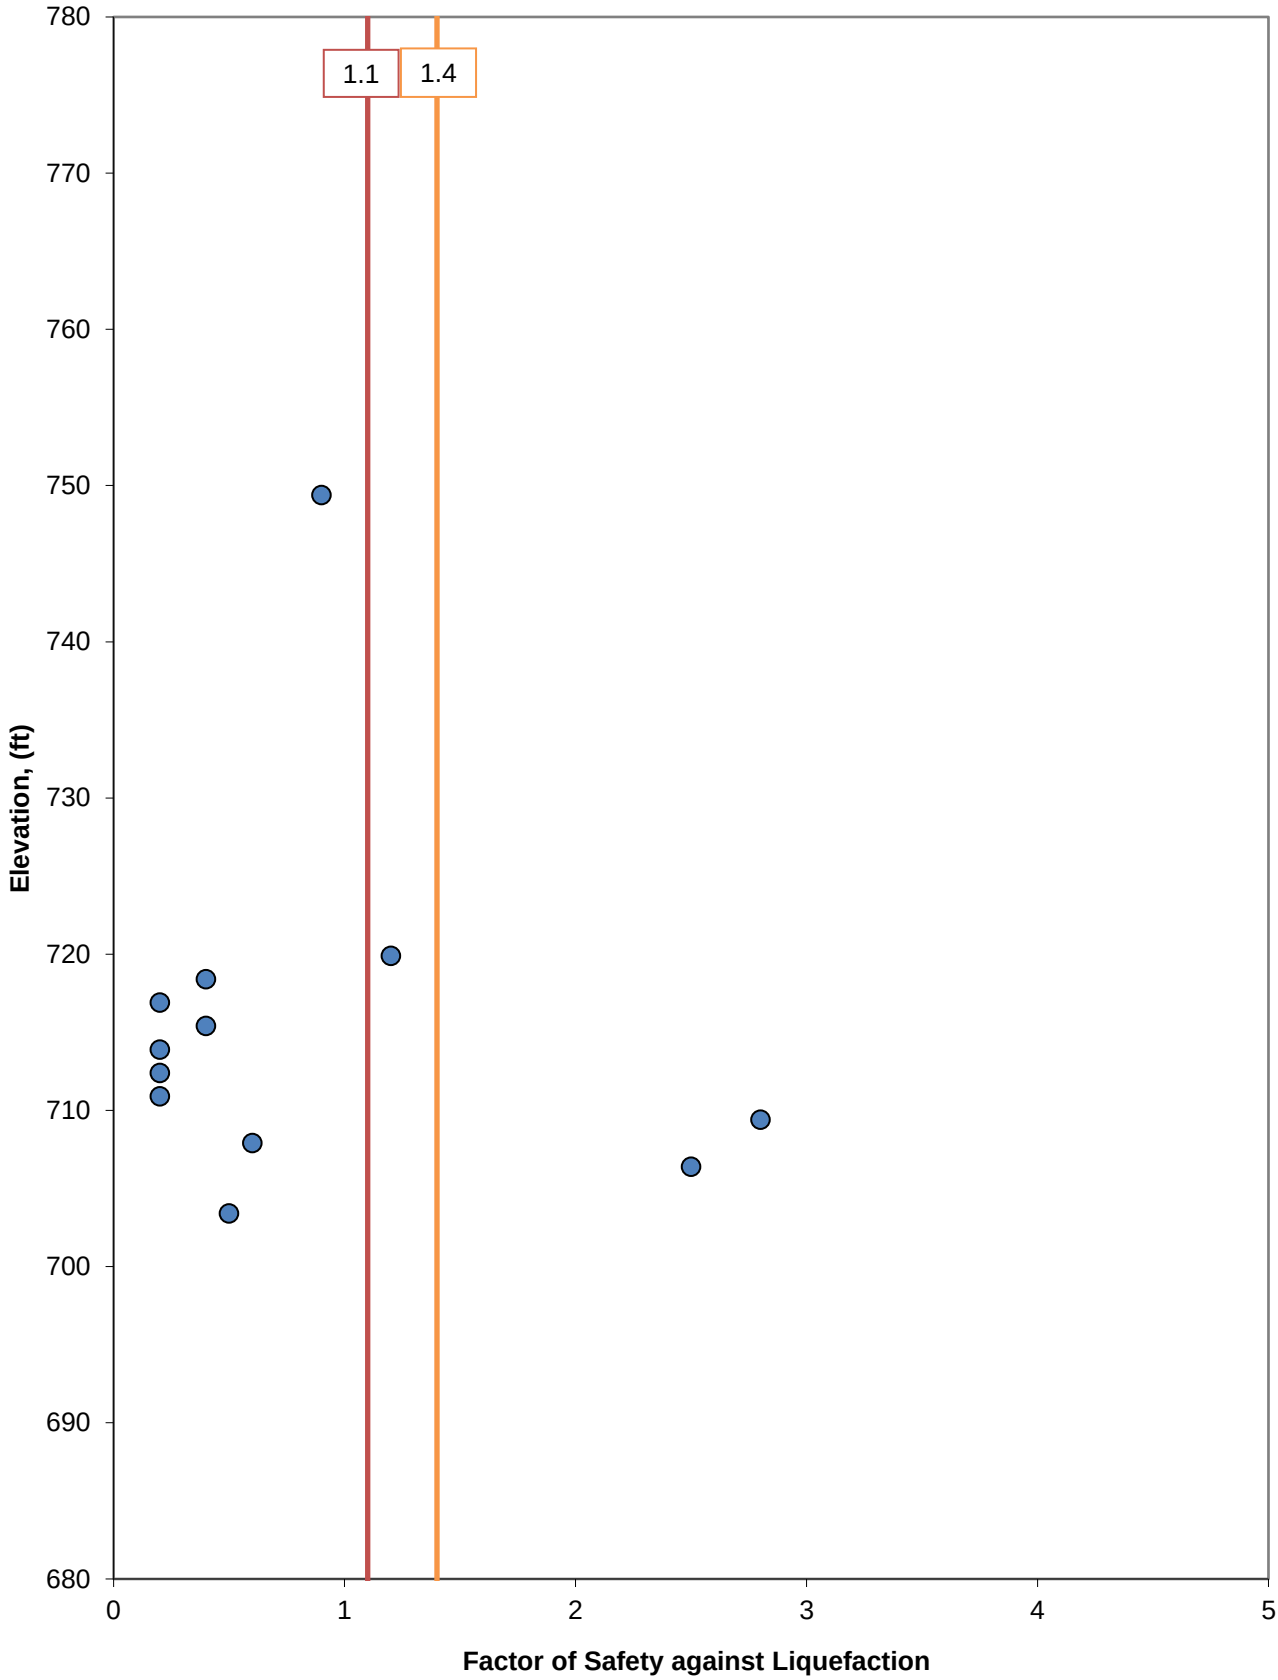
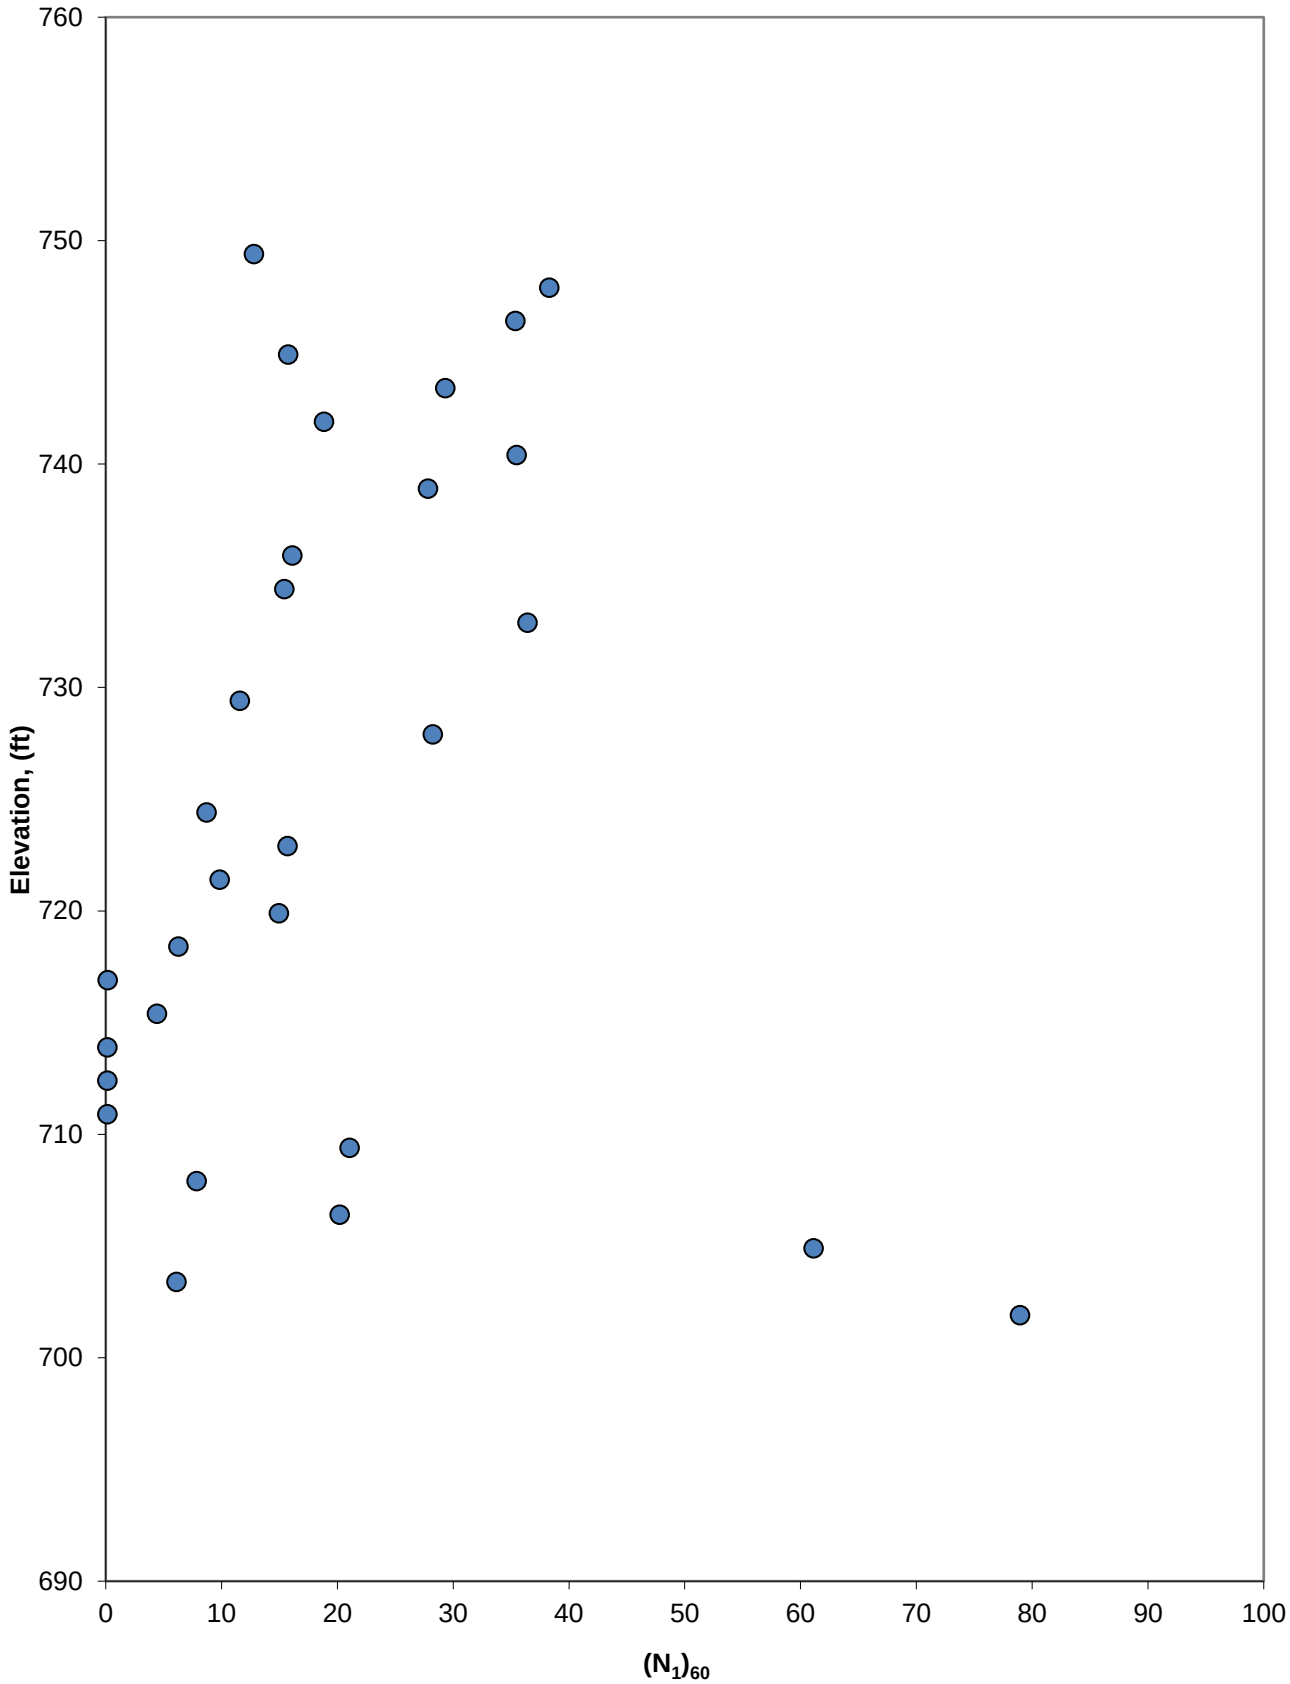
KIF-STN51, Liquefaction Triggering Results



KIF TDEC Stability, Boring ID: KIF-STN51, Source = 10 Hz, Mw = 6, Event = Design EQ,
SPT Data, Simplified Stress-Based Approach



KIF TDEC Stability, Boring ID: KIF-STN51, Source = 10 Hz, Mw = 6, Event = Design EQ, SPT Data, Simplified Stress-Based Approach



3.4 CPT-BASED LIQUEFACTION ASSESSMENT FOR SAND-LIKE SOILS

3.4.1 1 Hz Design Earthquake

Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-01B

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	755.0	feet
Water Depth during CPT (negative for U/S borings) =	3.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ =	755.3	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	Section_AA, KIF-A2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	Section_AA, KIF-A2_NOR	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-01B

Water Elevation during CPT:	752.0	ft
Depth to Water during CPT:	3.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	749.1	ft
Depth to Water during Earthquake:	5.9	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	755.3	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.3	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.02	tsf

Elev. (ft)	Depth z (ft)	Cone Tip Resistance qt (tsf)	Sleeve Friction f_s (tsf)	Unit Weight Υ (pcf)	Top of Sampling Interval (ft)	Thickness of Sampling Interval (ft)	Total Vertical Stress during CPT $\sigma_{v\,CPT}$ (tsf)	Total Vertical Stress during EQ $\sigma_{v\,EQ}$ (tsf)	Static Pore Water Pressure during CPT $u_{S\,CPT}$ (tsf)	Static Pore Water Pressure during EQ $u_{S\,EQ}$ (tsf)	Effective Vertical Stress during CPT $\sigma_{v\,CPT}'$ (tsf)	Effective Vertical Stress during EQ $\sigma_{v\,EQ}'$ (tsf)

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-01B**

Depth to Water during Earthquake:	5.9	ft
Final Grade Elevation during EQ:	755.3	ft
Height of Final Grade above CPT TOH:	0.3	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

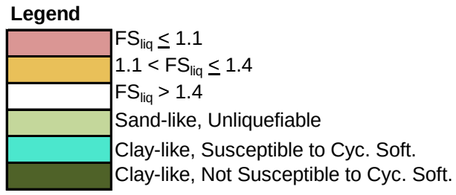
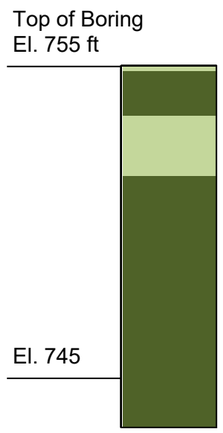
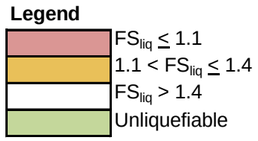
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.

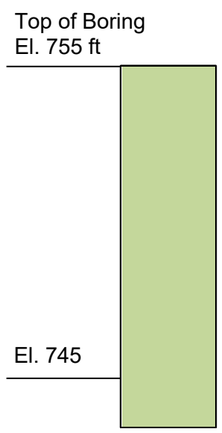


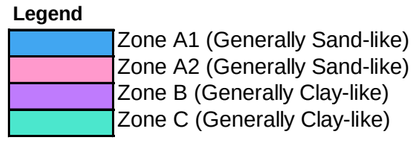
CPT-01B, Liquefaction Triggering Results



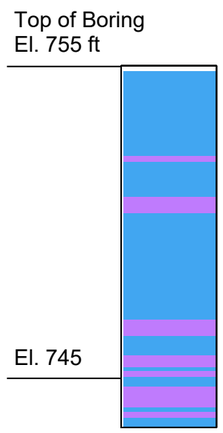


CPT-01B, Liquefaction Triggering Results

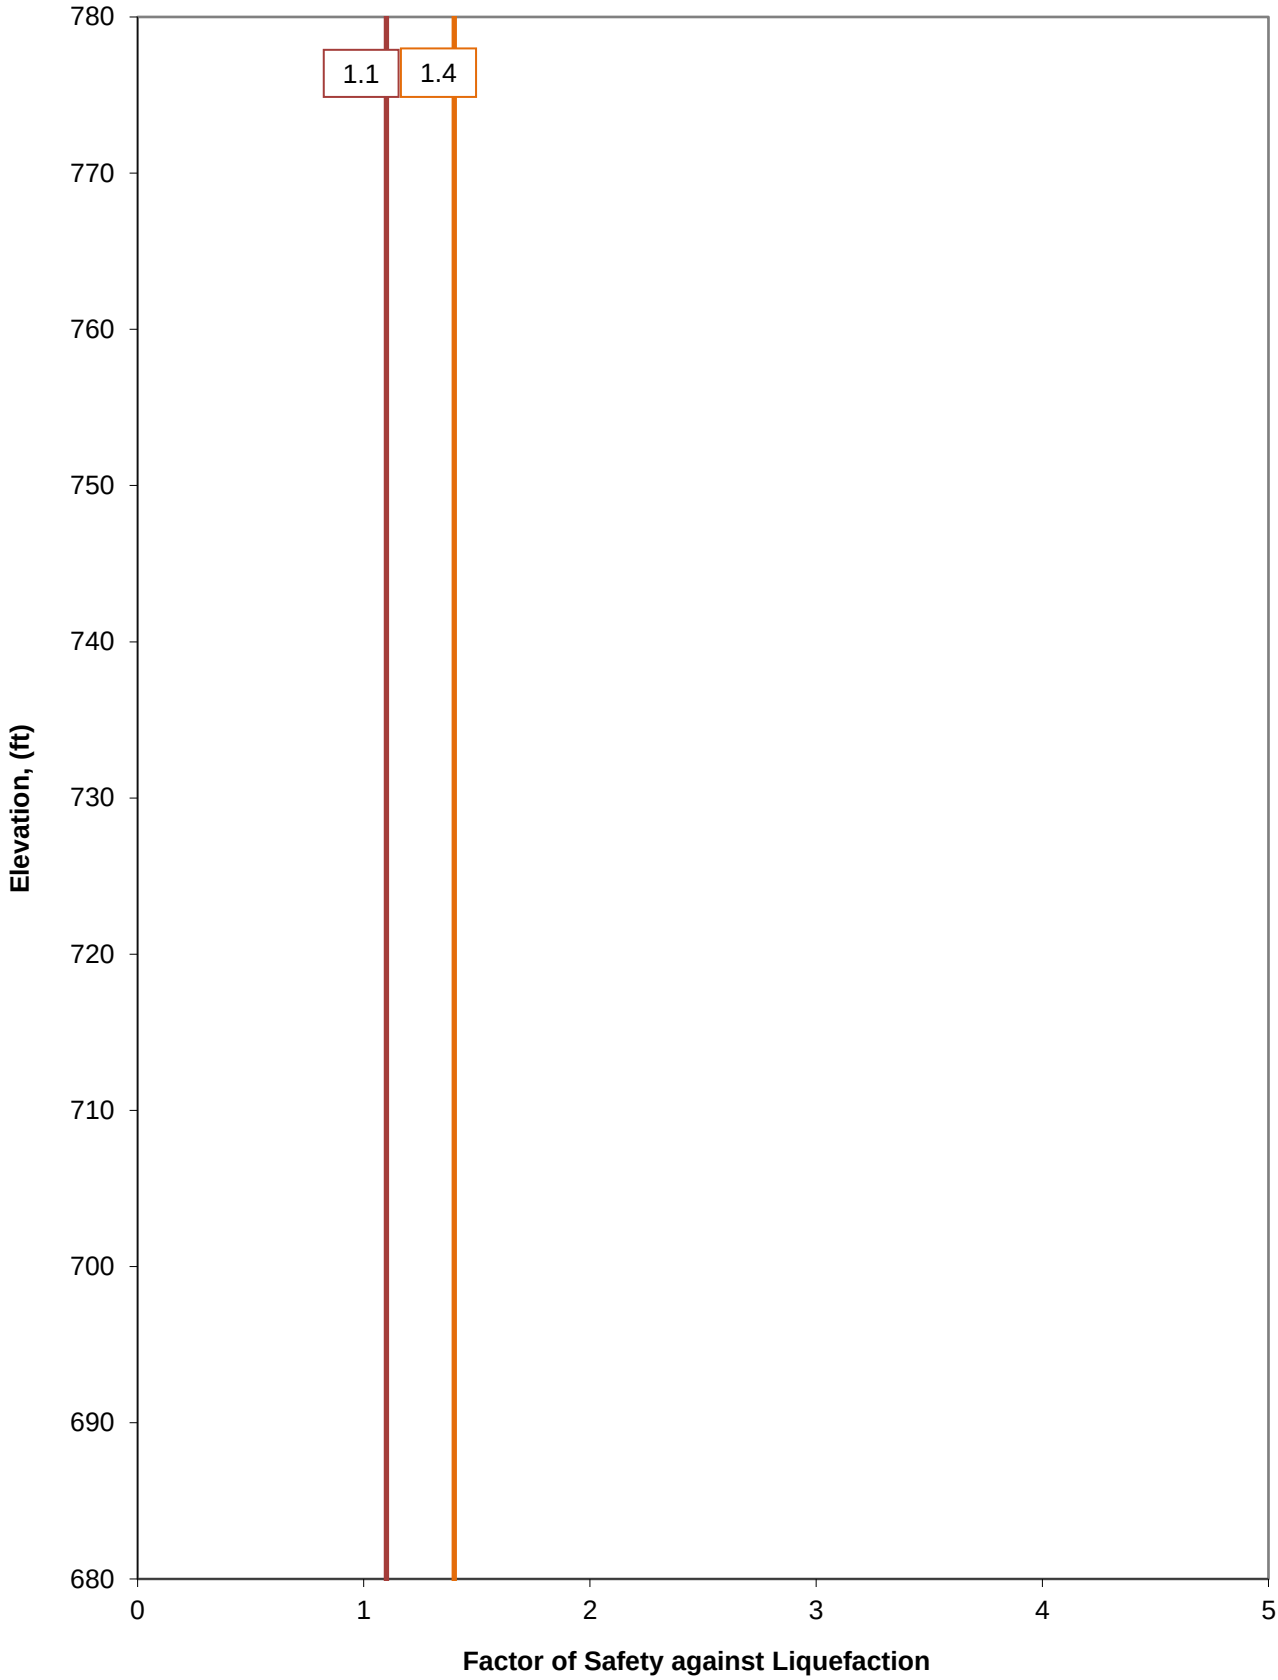




CPT-01B, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-01B, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-02D

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	755.0	feet
Water Depth during CPT (negative for U/S borings) =	2.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ =	755.3	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	Section_AA, KIF-A2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	Section_AA, KIF-A2_NOR	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-02D

Water Elevation during CPT:	753.0	ft
Depth to Water during CPT:	2.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	749.1	ft
Depth to Water during Earthquake:	5.9	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	755.3	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.3	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.02	tsf

Elev. LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: KIF TDEC Stability
Stantec Project No.: 175668043
CPT ID: CPT-02D

Depth to Water during Earthquake:	5.9	ft
Final Grade Elevation during EQ:	755.3	ft
Height of Final Grade above CPT TOH:	0.3	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

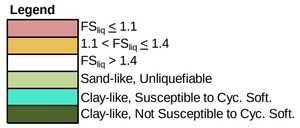
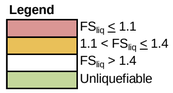
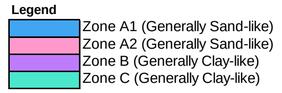
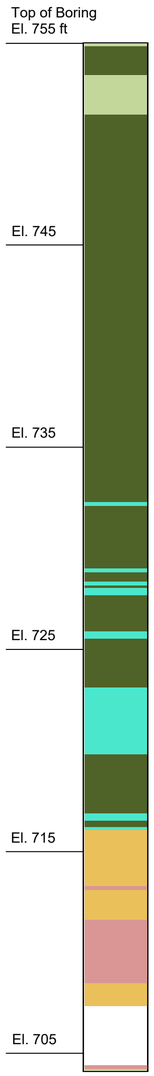
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



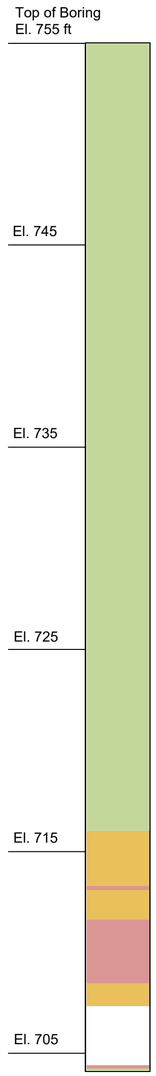




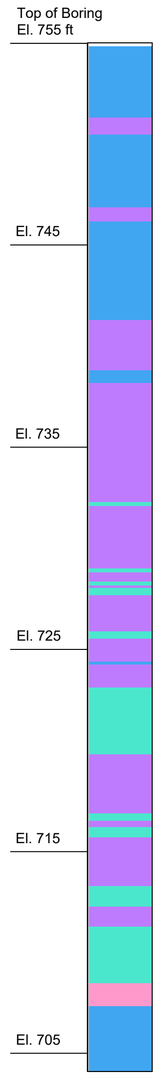
CPT-02D, Liquefaction Triggering Results



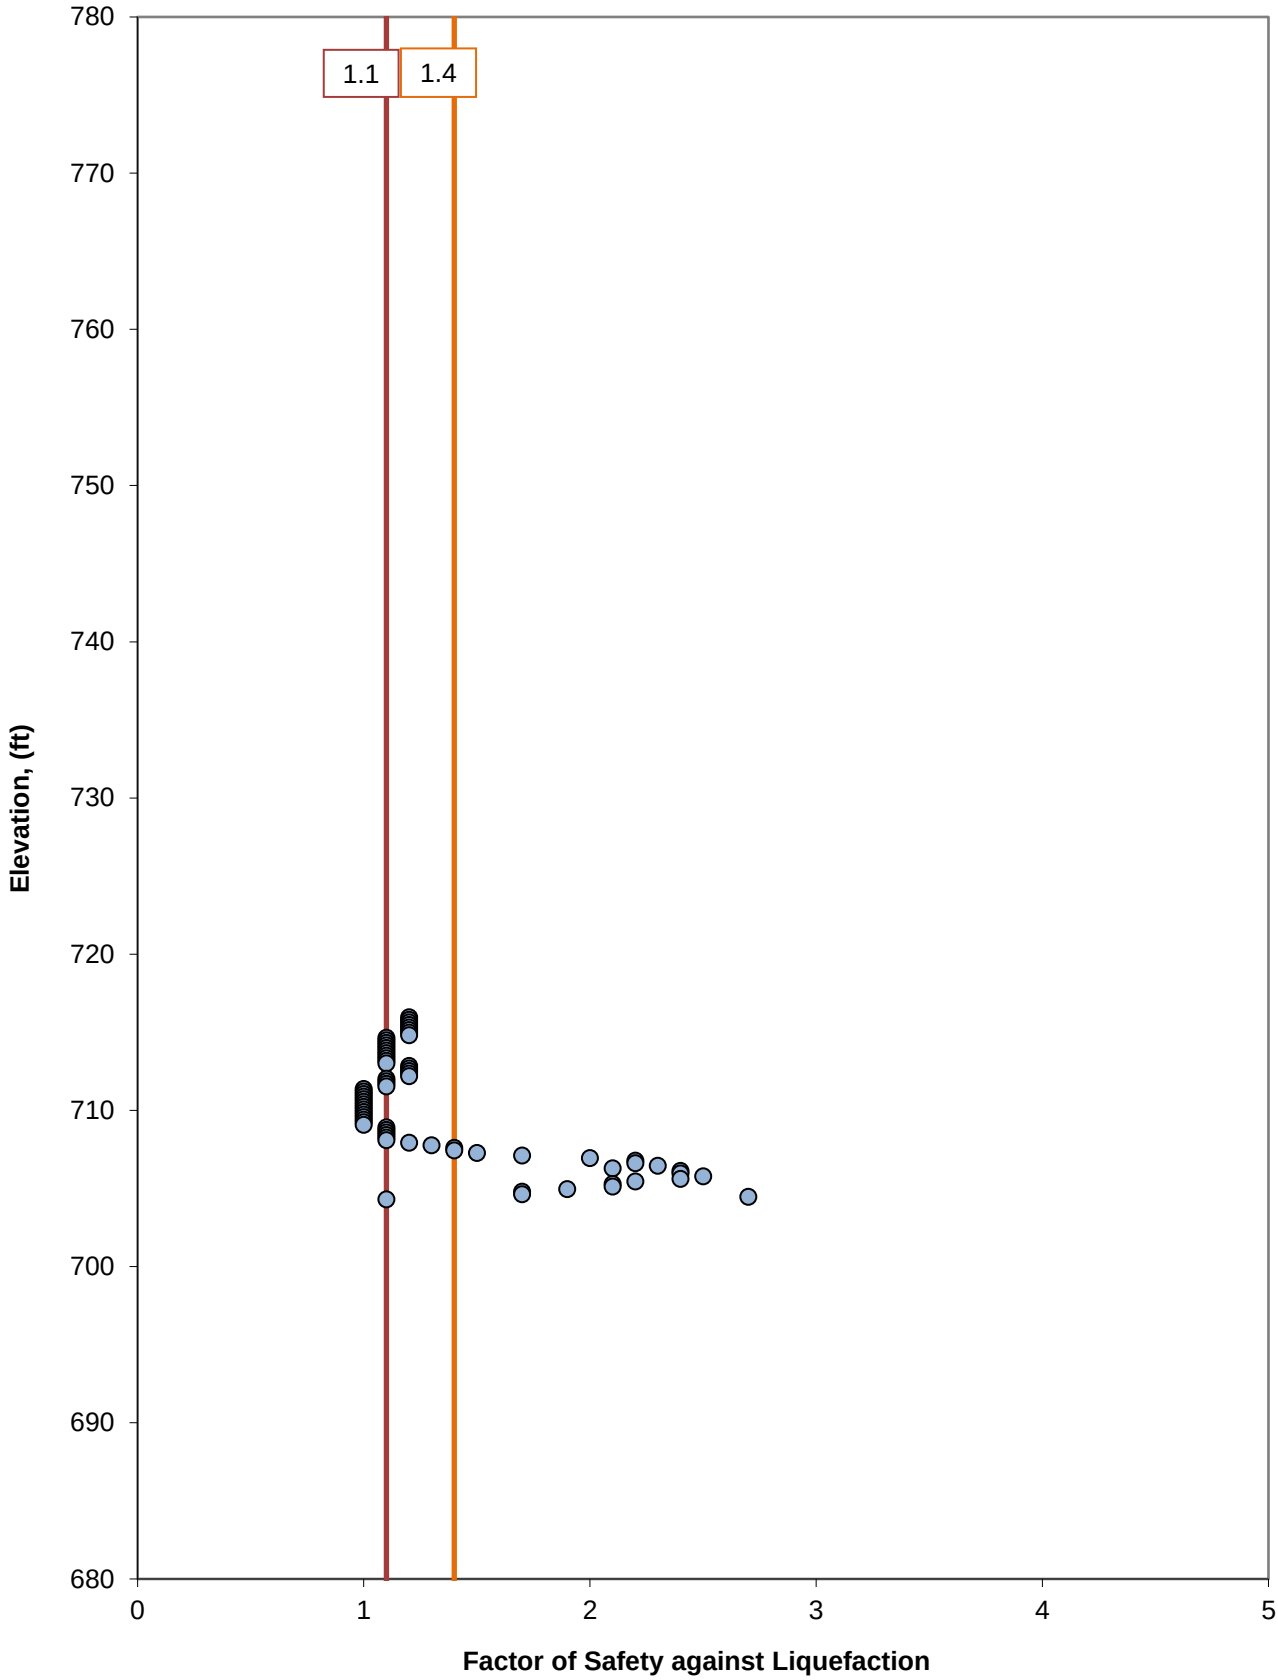
CPT-02D, Liquefaction Triggering Results



CPT-02D, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-02D, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-03C

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	754.0	feet
Water Depth during CPT (negative for U/S borings) =	4.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.3	feet
Final Grade Elevation during EQ =	753.8	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	Section_AA, KIF-A2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_σ will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	Section_AA, KIF-CPT03_NOR	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-03C

Water Elevation during CPT:	750.0	ft
Depth to Water during CPT:	4.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	748.7	ft
Depth to Water during Earthquake:	5.3	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	753.8	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-0.2	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.01	tsf

Elev. LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-03C**

Depth to Water during Earthquake:	5.3	ft
Final Grade Elevation during EQ:	753.8	ft
Height of Final Grade above CPT TOH:	-0.2	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

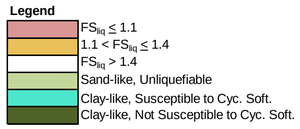
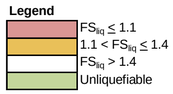
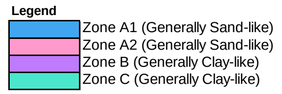
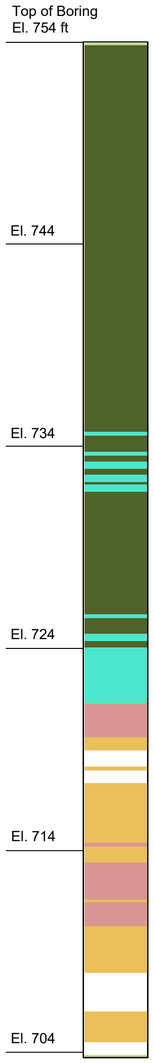
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



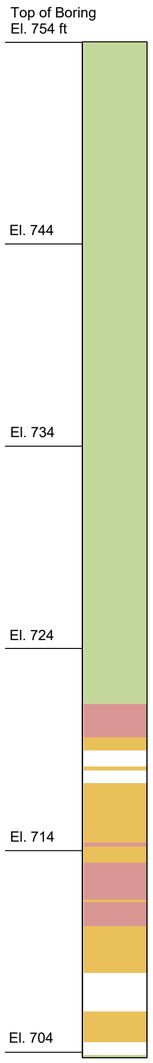




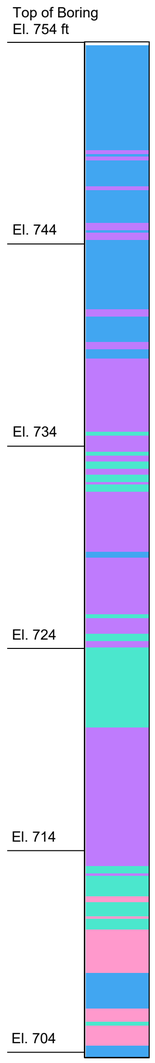
CPT-03C, Liquefaction Triggering Results



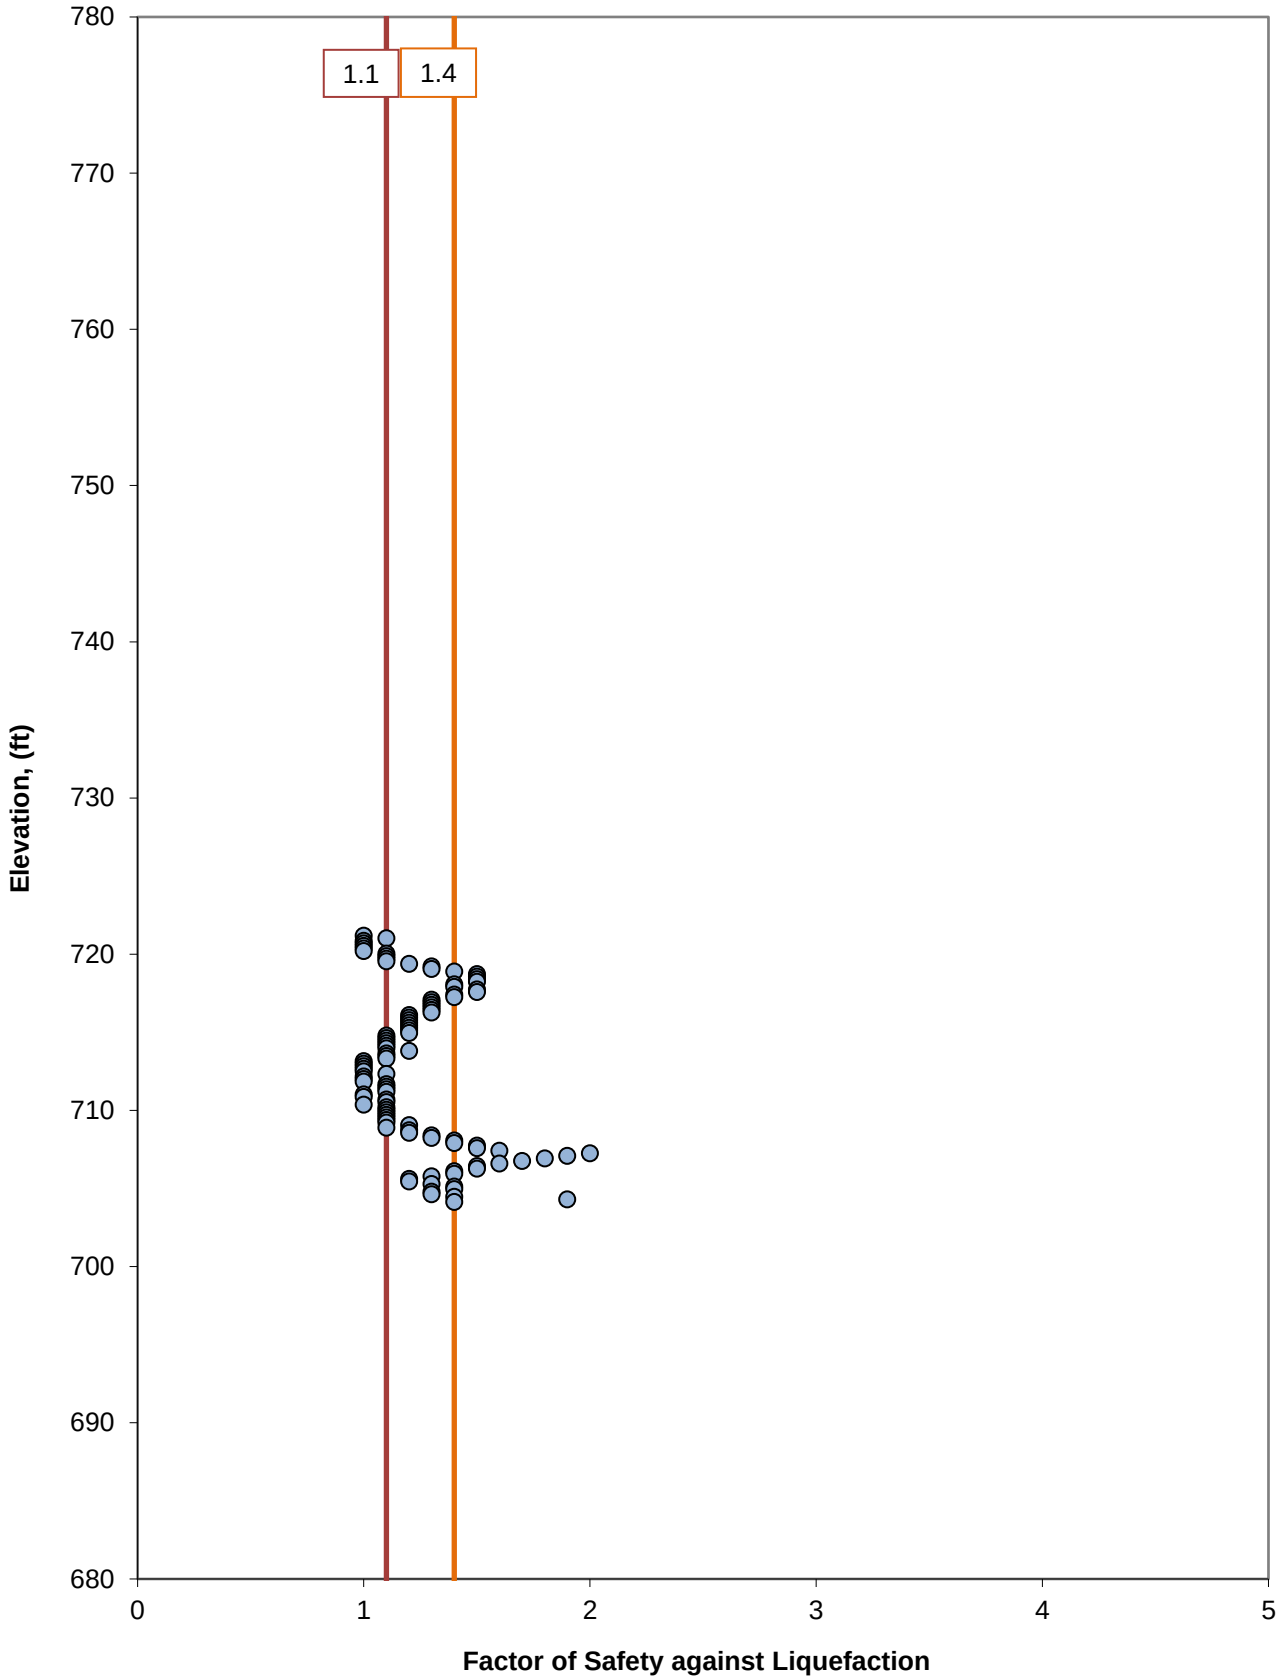
CPT-03C, Liquefaction Triggering Results



CPT-03C, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-03C, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Inputs

Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-04A

Boring Location (optional)

Northing =	
Easting =	
OR	
Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	753.0	feet
Water Depth during CPT (negative for U/S borings) =	6.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	4.6	feet
Final Grade Elevation during EQ =	752.2	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	ng_Pond_Section, KIF-BF-SPT3_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT3	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-04A

Water Elevation during CPT:	747.0	ft
Depth to Water during CPT:	6.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	748.4	ft
Depth to Water during Earthquake:	4.6	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	752.2	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-0.8	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.05	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-04A**

Depth to Water during Earthquake:	4.6	ft
Final Grade Elevation during EQ:	752.2	ft
Height of Final Grade above CPT TOH:	-0.8	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

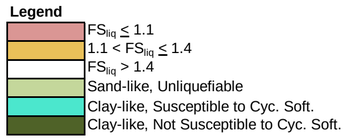
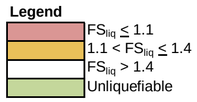
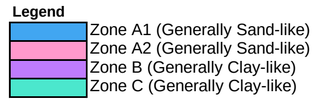
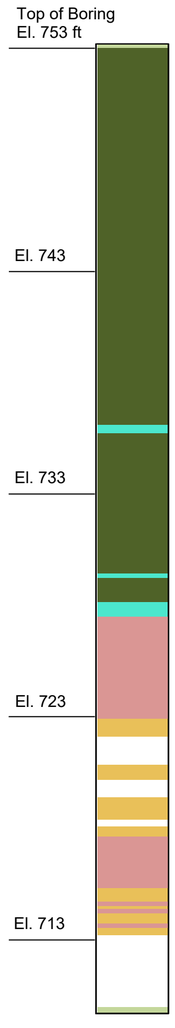
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



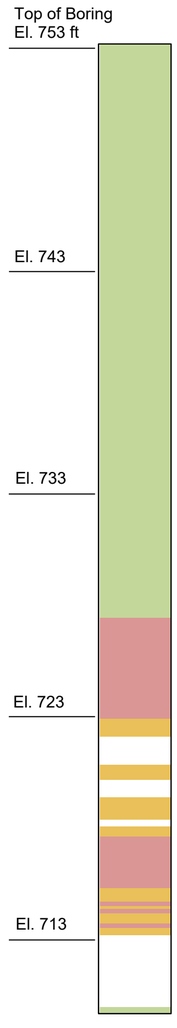




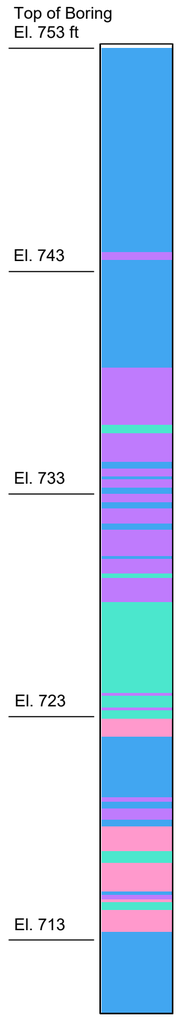
CPT-04A, Liquefaction Triggering Results



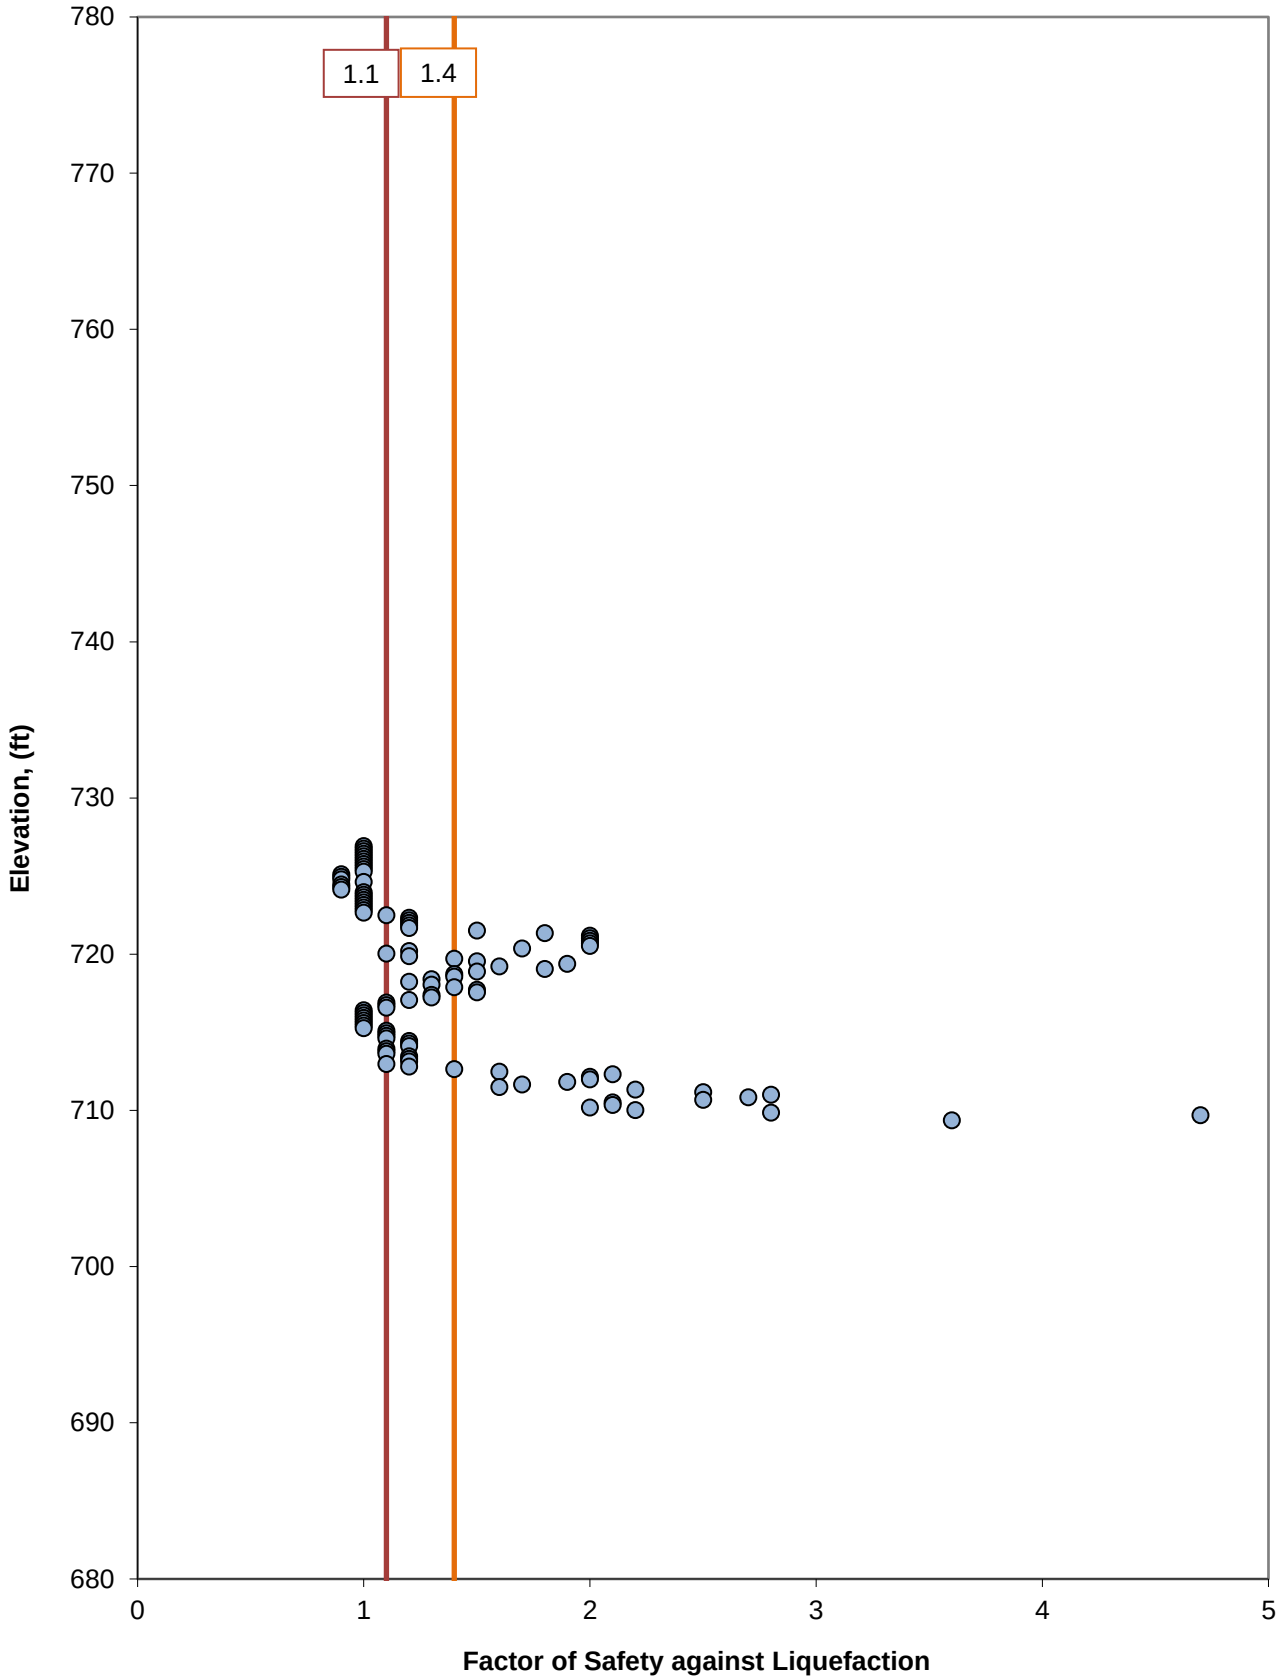
CPT-04A, Liquefaction Triggering Results



CPT-04A, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-04A, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-05A

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	754.0	feet
Water Depth during CPT (negative for U/S borings) =	2.5	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.0	feet
Final Grade Elevation during EQ =	753.0	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	ng_Pond_Section, KIF-BF-SPT3_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT3	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-05A

Water Elevation during CPT:	751.5	ft
Depth to Water during CPT:	2.5	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	749.0	ft
Depth to Water during Earthquake:	5.0	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	753	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-1.0	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.06	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-05A

Elev. (ft)	Depth z (ft)	Normalized Cone Resistance Q	Normalized Friction Ratio F (%)	Soil Behavior Type Index I_C	Soil Type Exponent n	Normalizing Factor for CPT Resistance C_N	Normalized Average Cone Tip Resistance qc_{1N}	Fines Content FC (%)	Clean Sand Correction $\Delta qc1N$	Clean Sand Normalized Average Cone Tip Resistance $(qc_{1N})_{CS}$	Static Shear Stress Ratio α	Relative State Parameter Index ξ_R

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-05A**

Depth to Water during Earthquake:	5.0	ft
Final Grade Elevation during EQ:	753.0	ft
Height of Final Grade above CPT TOH:	-1.0	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

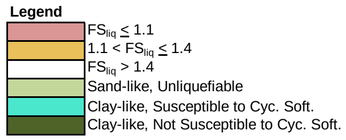
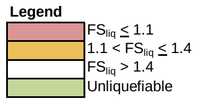
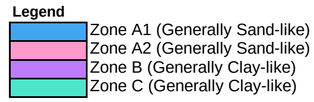
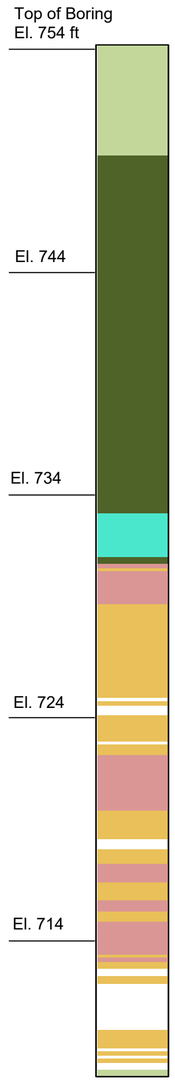
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



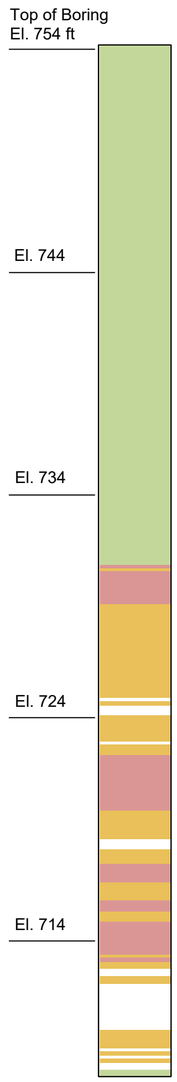




CPT-05A, Liquefaction Triggering Results

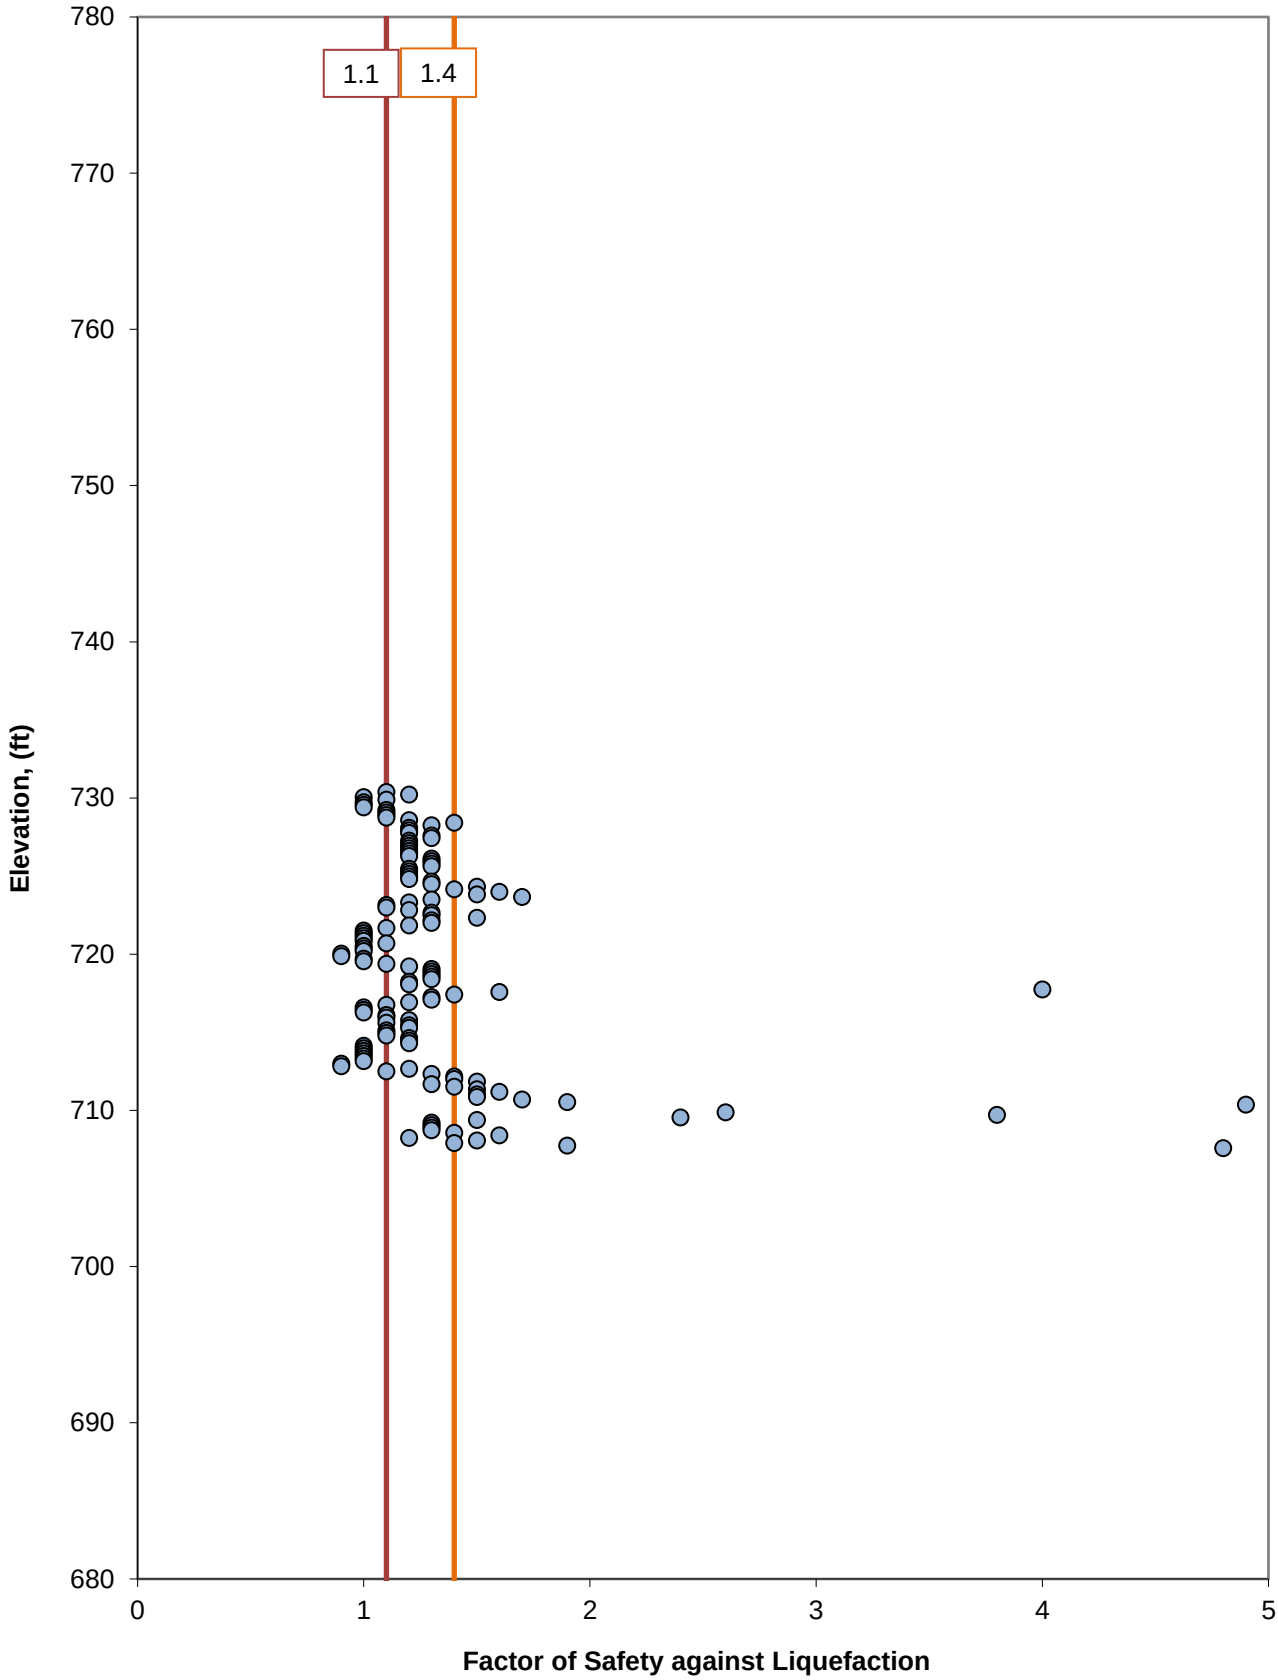


CPT-05A, Liquefaction Triggering Results



CPT-05A, Robertson Soil Type

KIF TDEC Stability, Boring = CPT-05A, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-07

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	754.0	feet
Water Depth during CPT (negative for U/S borings) =	6.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.0	feet
Final Grade Elevation during EQ =	753.0	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	ng_Pond_Section, KIF-BF-SPT3_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT3	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-07

Water Elevation during CPT:	748.0	ft
Depth to Water during CPT:	6.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	749.0	ft
Depth to Water during Earthquake:	5.0	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	753	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-1.0	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.06	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-07**

Depth to Water during Earthquake:	5.0	ft
Final Grade Elevation during EQ:	753.0	ft
Height of Final Grade above CPT TOH:	-1.0	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

Shear Stress Fit Parameters

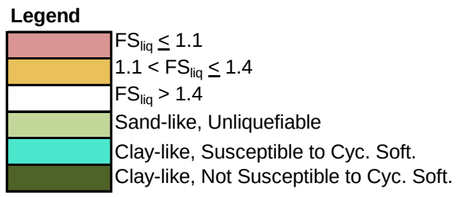
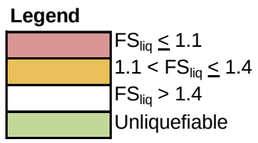
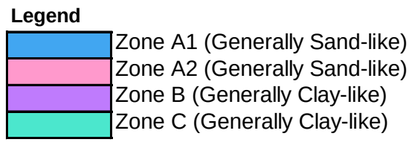
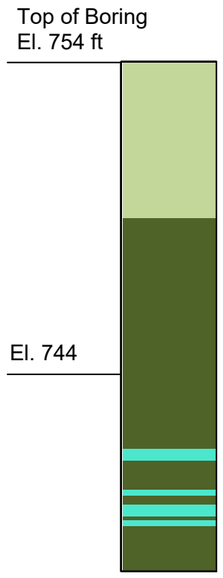
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



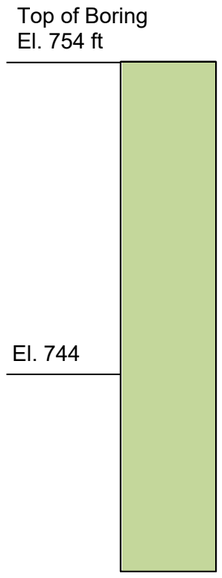




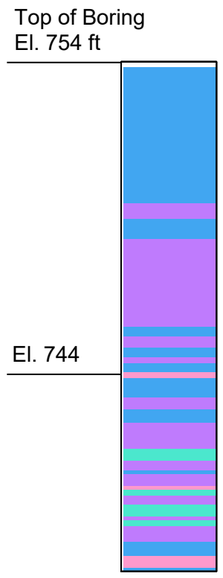
CPT-07, Liquefaction Triggering Results



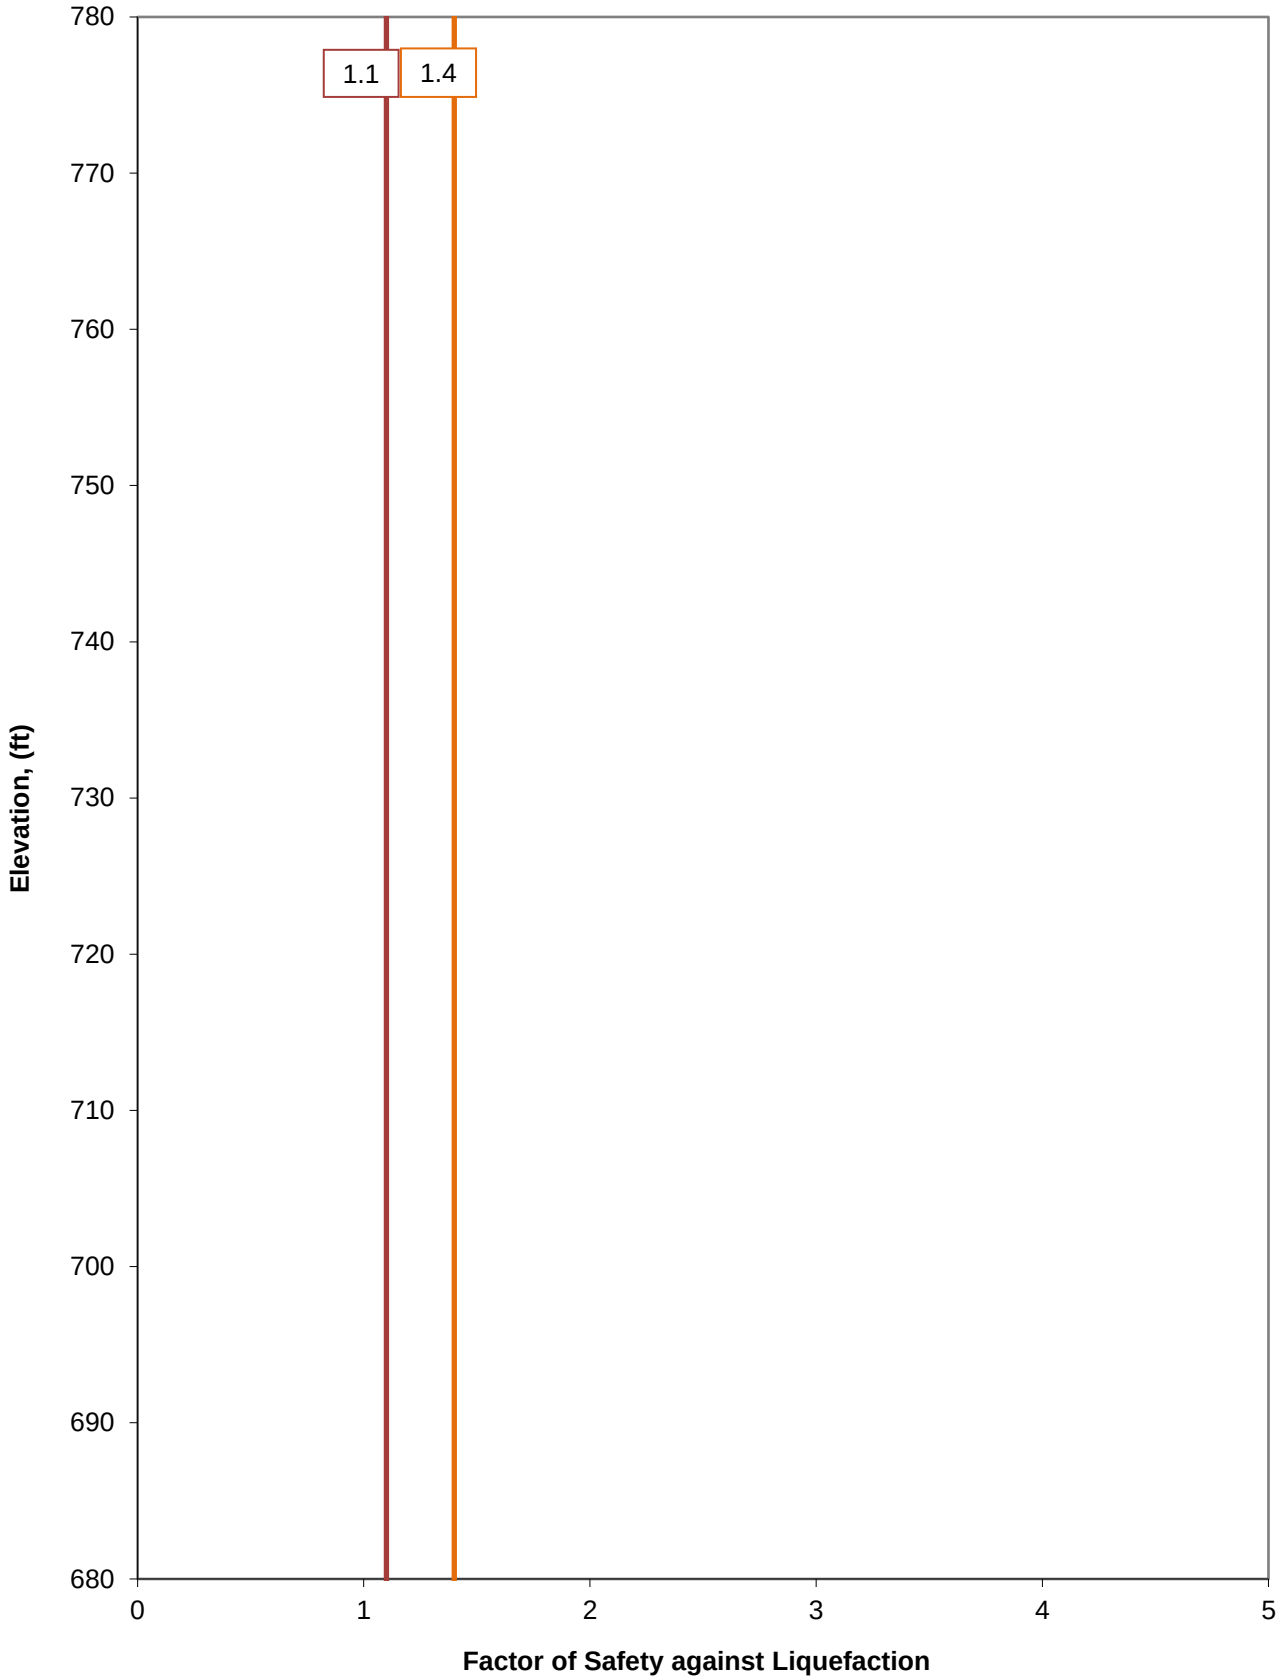
CPT-07, Liquefaction Triggering Results



CPT-07, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-07, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Inputs

Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	KIF-BF-CPT-2

Boring Location (optional)

Northing =	
Easting =	
OR	
Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	769.0	feet
Water Depth during CPT (negative for U/S borings) =	14.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	122.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	15.0	feet
Final Grade Elevation during EQ =	769.0	feet
Avg. Total Unit Wt. of Cut/Fill =	122	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	ng_Pond_Section, KIF-BF-CPT2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT5	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.10
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: KIF-BF-CPT-2

Water Elevation during CPT:	755.0	ft
Depth to Water during CPT:	14.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	754.0	ft
Depth to Water during Earthquake:	15.0	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	769	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.0	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	122	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.00	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: KIF TDEC Stability
Stantec Project No.: 175668043
CPT ID: KIF-BF-CPT-2

Depth to Water during Earthquake:	15.0	ft
Final Grade Elevation during EQ:	769.0	ft
Height of Final Grade above CPT TOH:	0.0	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.10	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

Shear Stress Fit Parameters

m4:	0
m3:	0
m2:	0

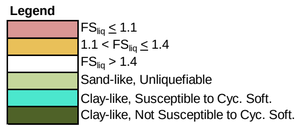
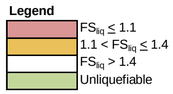
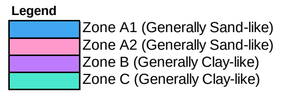
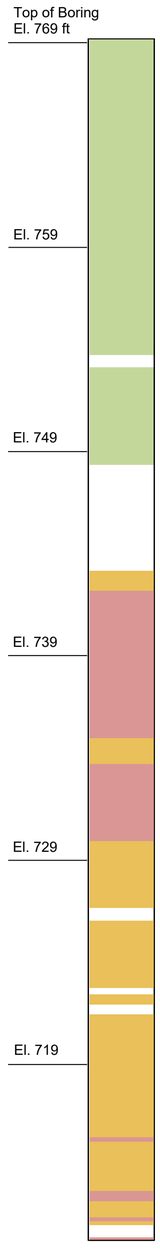
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



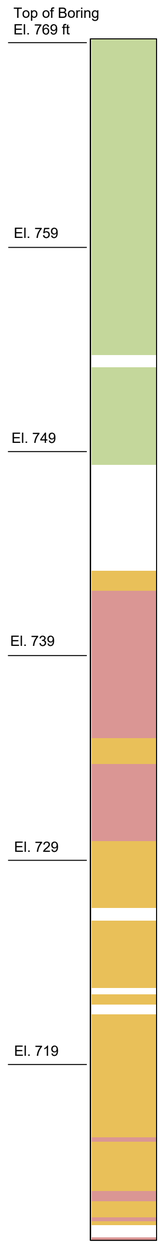




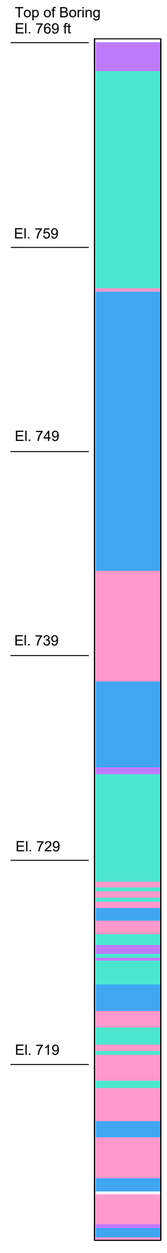
KIF-BF-CPT-2, Liquefaction Triggering Results



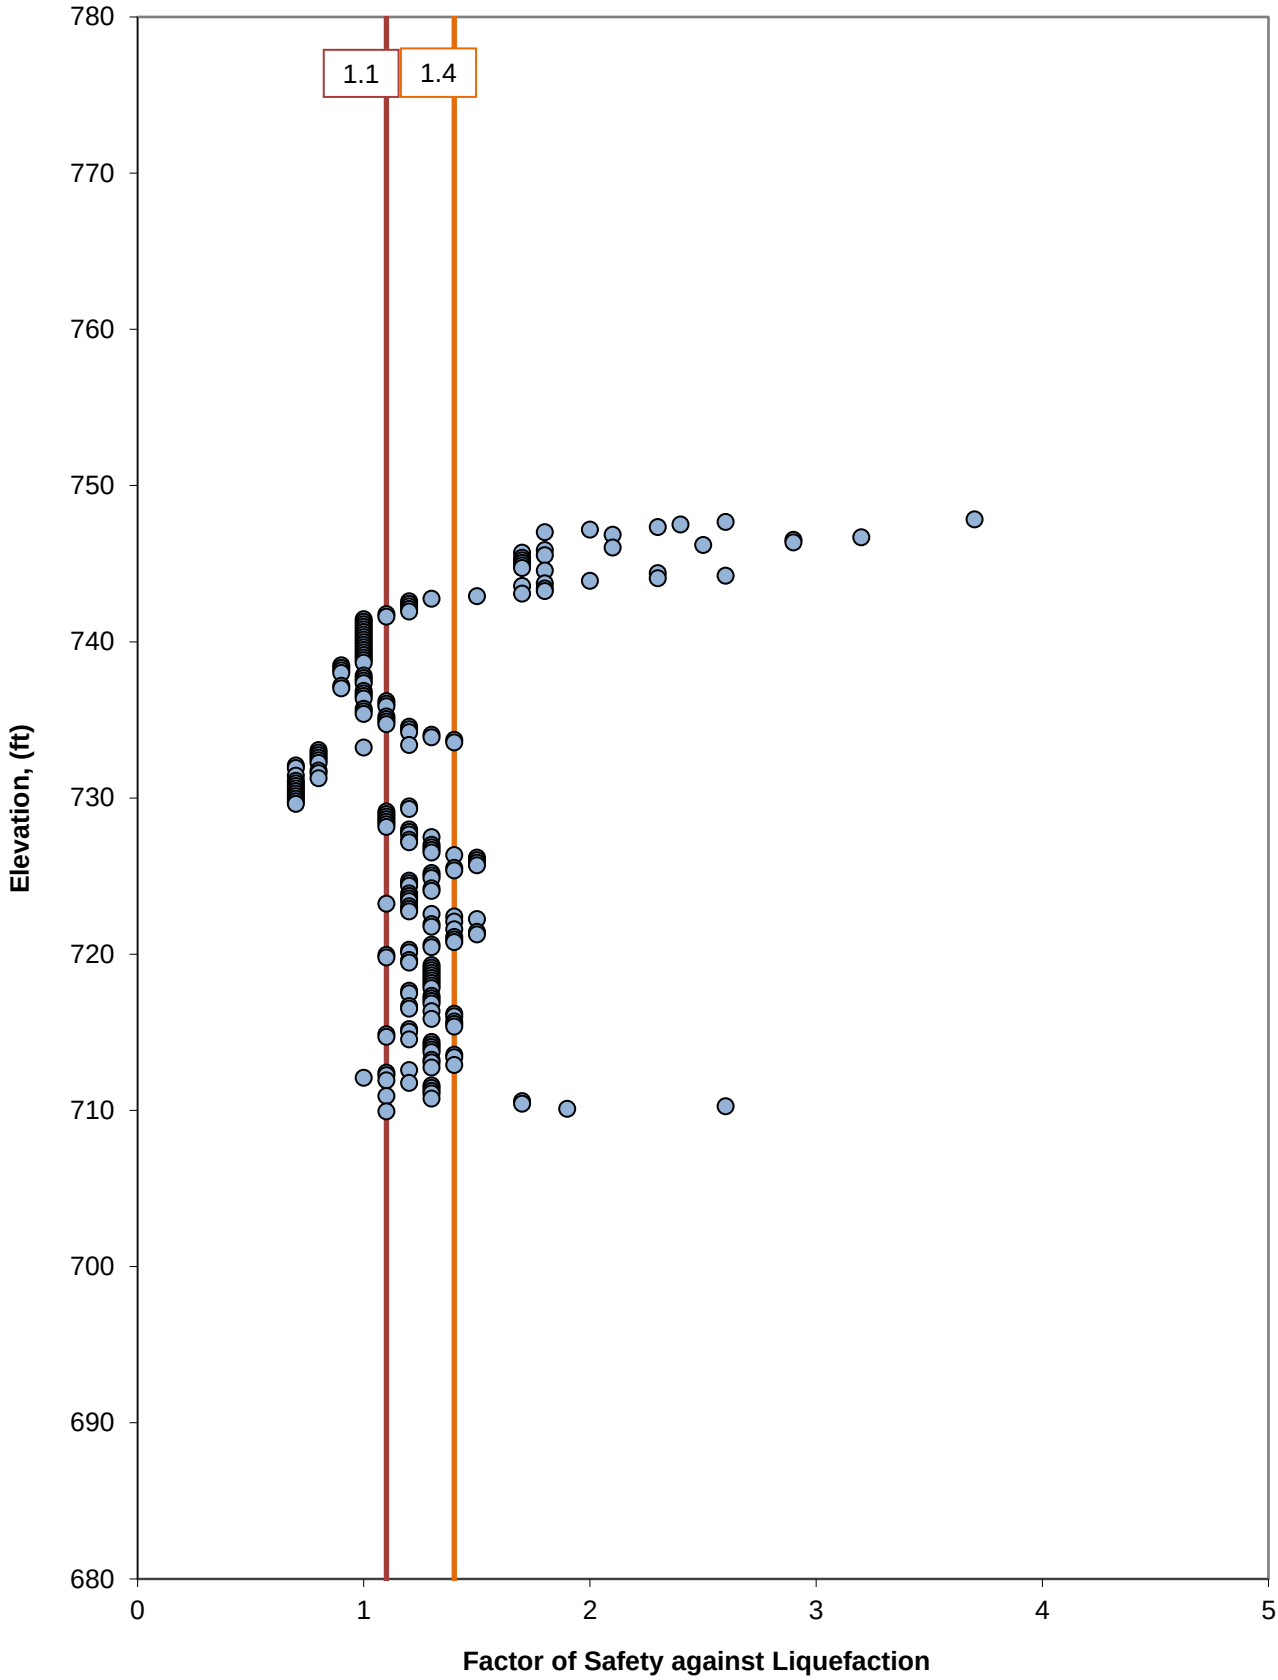
KIF-BF-CPT-2, Liquefaction Triggering Results



KIF-BF-CPT-2, Robertson Soil Type



KIF TDEC Stability, Boring = KIF-BF-CPT-2, Source = 1 Hz, Mw = 7.6, Event = Design EQ,
CPT Data, Simplified Stress-Based Approach



Inputs

Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	KIF-BF-CPT-3A

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	748.0	feet
Water Depth during CPT (negative for U/S borings) =	9.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	6.5	feet
Final Grade Elevation during EQ =	748.0	feet
Avg. Total Unit Wt. of Cut/Fill =		pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	g_Pond_Section, KIF-BF-CPT3A_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_σ will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT3	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.09
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: KIF-BF-CPT-3A

Water Elevation during CPT:	739.0	ft
Depth to Water during CPT:	9.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	741.5	ft
Depth to Water during Earthquake:	6.5	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	748	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.0	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	0	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.00	tsf

Elev. (ft)	Depth z (ft)	Cone Tip Resistance qt (tsf)	Sleeve Friction f_s (tsf)	Unit Weight Υ (pcf)	Top of Sampling Interval (ft)	Thickness of Sampling Interval (ft)	Total Vertical Stress during CPT $\sigma_{v\,CPT}$ (tsf)	Total Vertical Stress during EQ $\sigma_{v\,EQ}$ (tsf)	Static Pore Water Pressure during CPT $u_{S\,CPT}$ (tsf)	Static Pore Water Pressure during EQ $u_{S\,EQ}$ (tsf)	Effective Vertical Stress during CPT $\sigma_{v\,CPT}'$ (tsf)	Effective Vertical Stress during EQ $\sigma_{v\,EQ}'$ (tsf)

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: KIF TDEC Stability
Stantec Project No.: 175668043
CPT ID: KIF-BF-CPT-3A

Depth to Water during Earthquake:	6.5	ft
Final Grade Elevation during EQ:	748.0	ft
Height of Final Grade above CPT TOH:	0.0	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.09	g
Earthquake Magnitude:	7.60	M_W
Earthquake File or Source Zone:	1	Hz

Shear Stress Fit Parameters

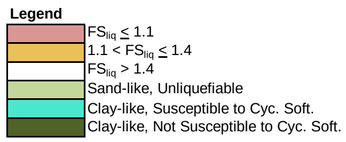
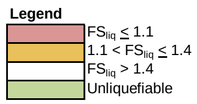
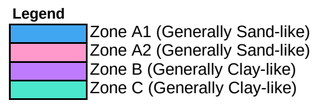
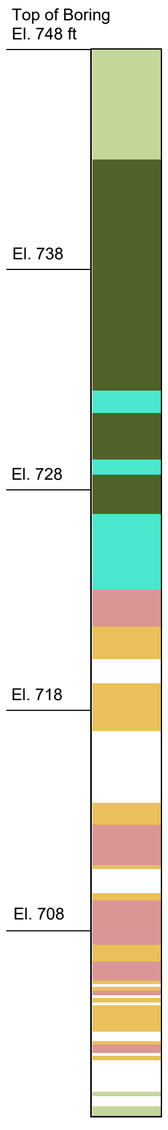
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



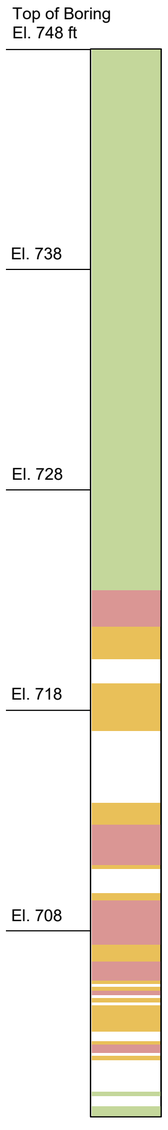




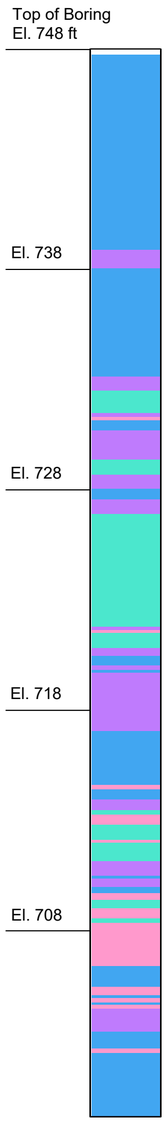
KIF-BF-CPT-3A, Liquefaction Triggering Results



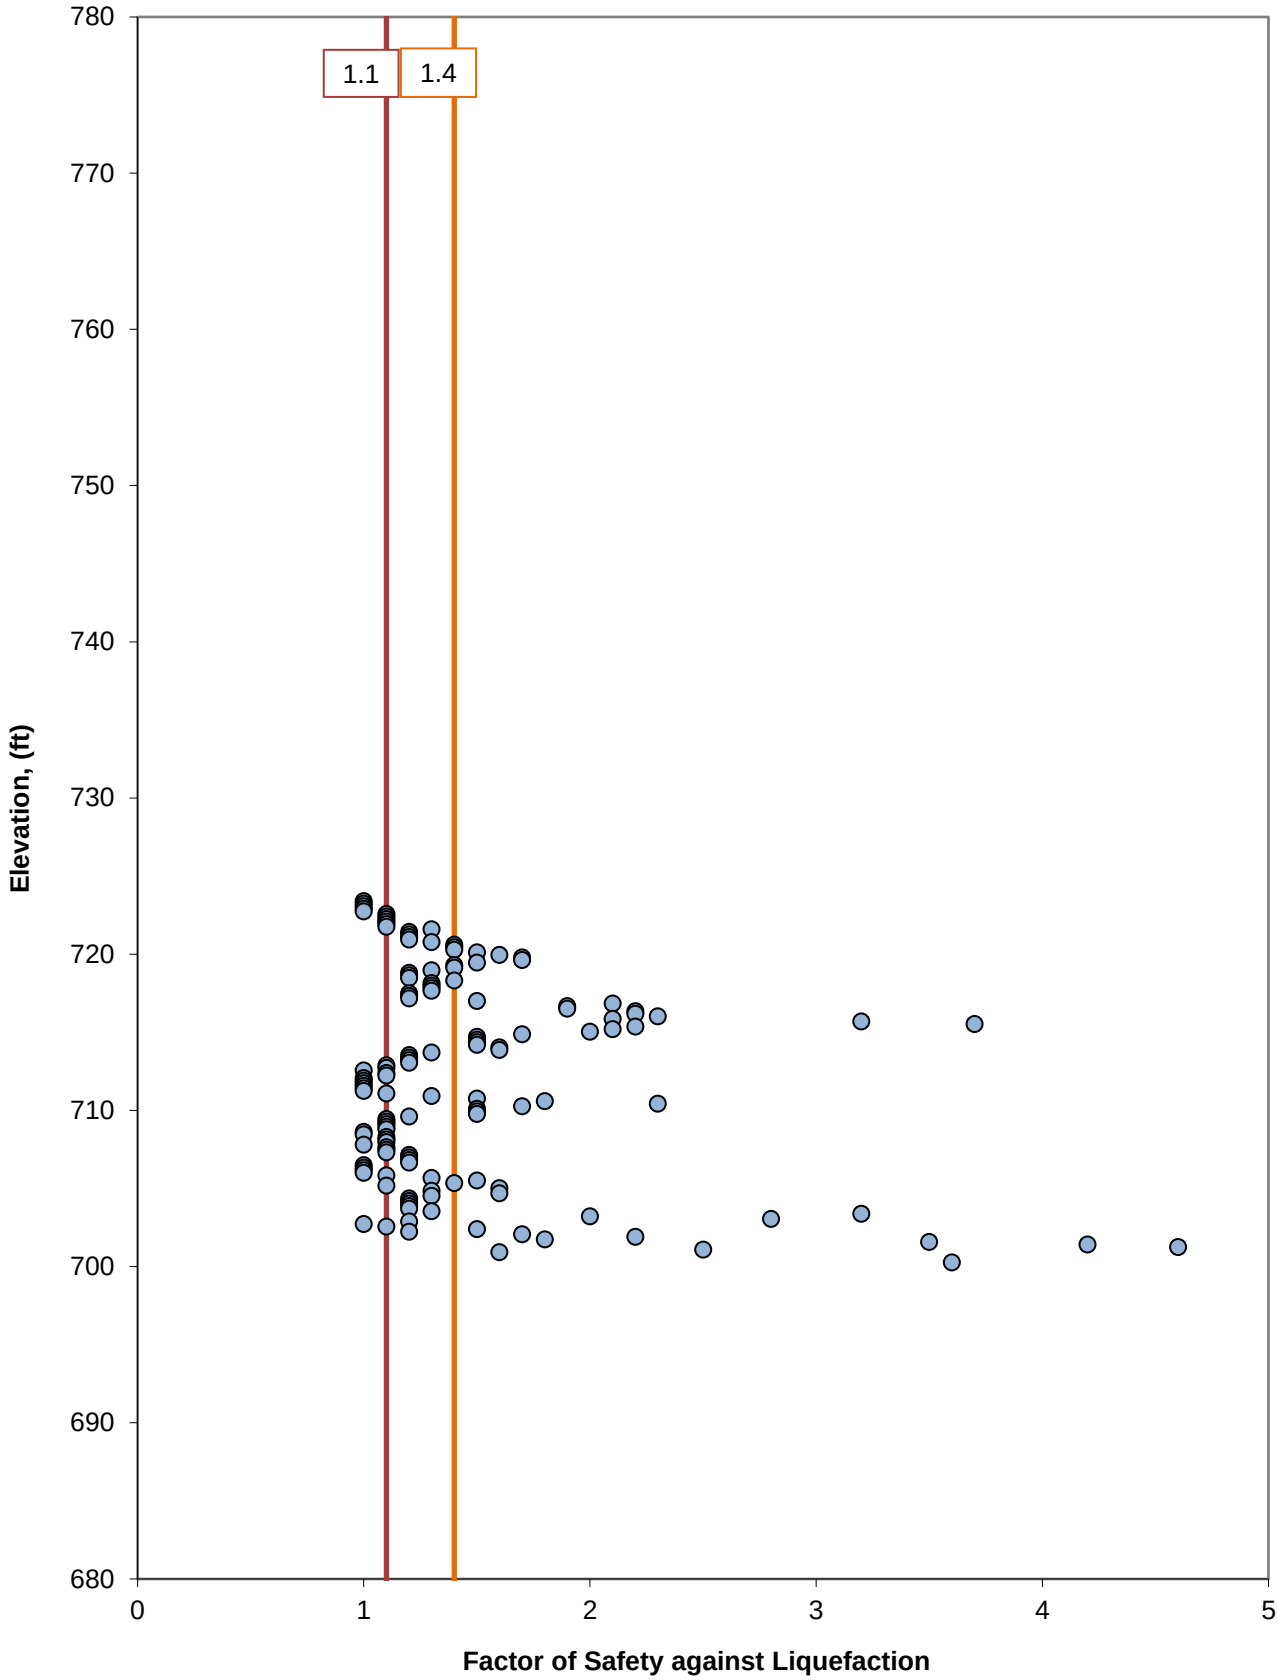
KIF-BF-CPT-3A, Liquefaction Triggering Results



KIF-BF-CPT-3A, Robertson Soil Type



KIF TDEC Stability, Boring = KIF-BF-CPT-3A, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Inputs

Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	KIF-BF-CPT-4AA

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	769.0	feet
Water Depth during CPT (negative for U/S borings) =	10.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	6.5	feet
Final Grade Elevation during EQ =	769.0	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	ng_Pond_Section, KIF-BF-SPT5_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	ning_Pond_Section, KIF-BF-CPT4AA	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: KIF-BF-CPT-4AA

Water Elevation during CPT:	759.0	ft
Depth to Water during CPT:	10.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	762.5	ft
Depth to Water during Earthquake:	6.5	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	769	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.0	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.00	tsf

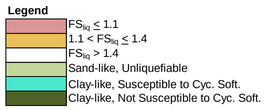
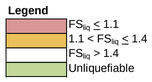
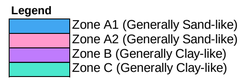
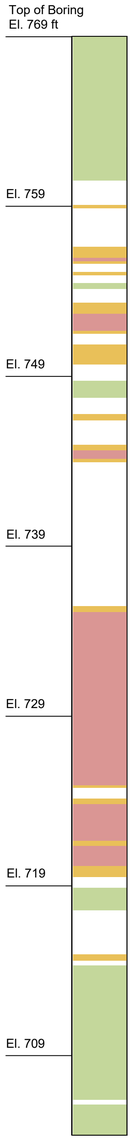
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



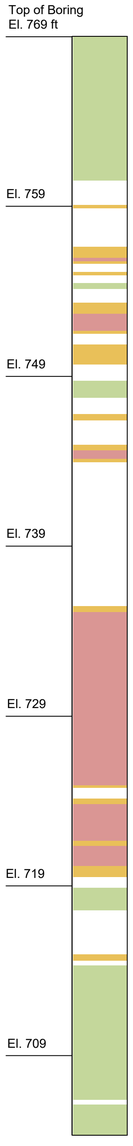




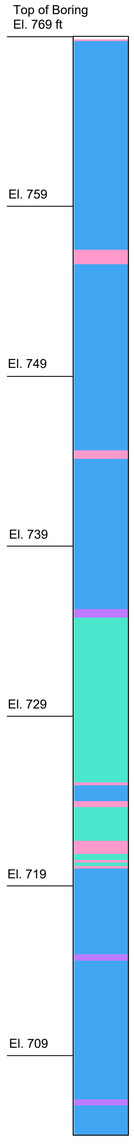
KIF-BF-CPT-4AA, Liquefaction Triggering Results



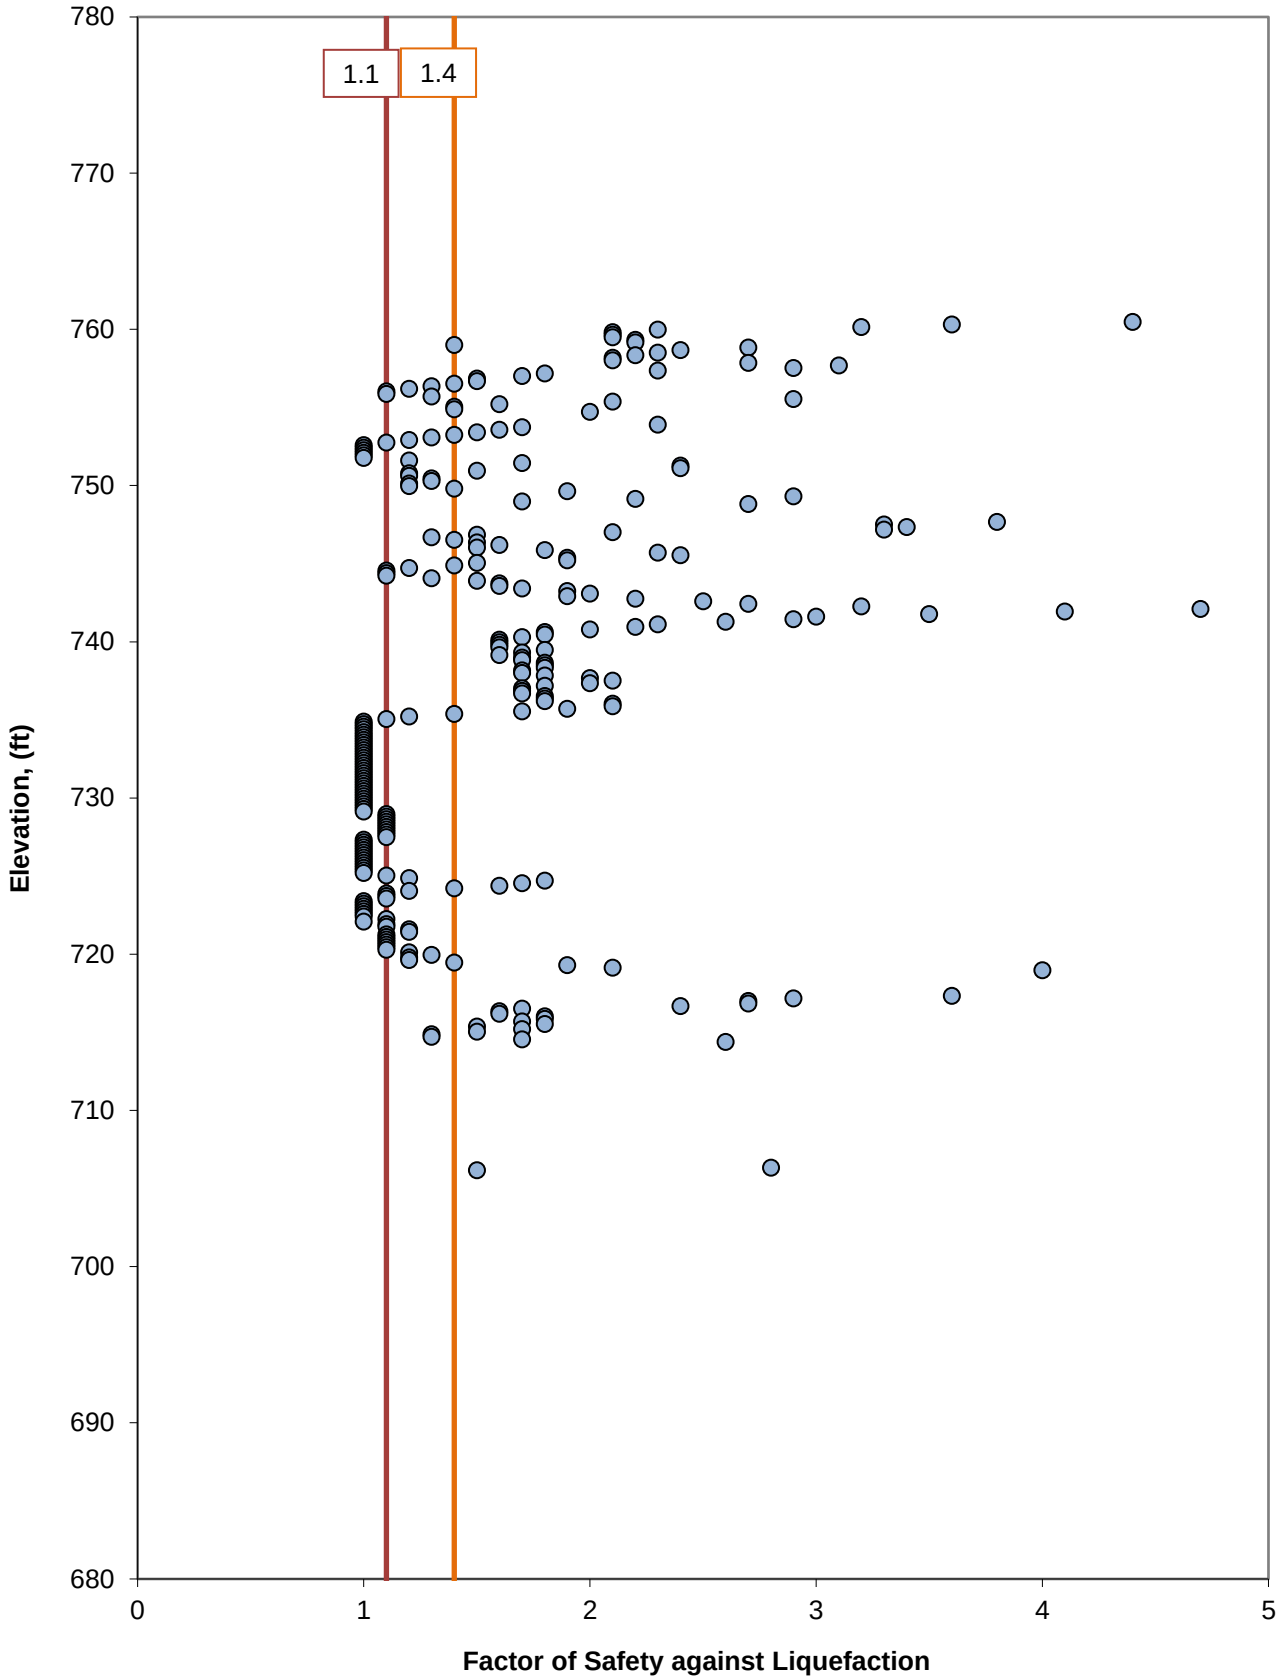
KIF-BF-CPT-4AA, Liquefaction Triggering Results



KIF-BF-CPT-4AA, Robertson Soil Type



KIF TDEC Stability, Boring = KIF-BF-CPT-4AA, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	KIF-BF-CPT-5B

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	769.0	feet
Water Depth during CPT (negative for U/S borings) =	13.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	122.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	15.0	feet
Final Grade Elevation during EQ =	766.0	feet
Avg. Total Unit Wt. of Cut/Fill =	122	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	g_Pond_Section, KIF-BF-CPT5B_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT5	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	1 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.10
EQ Mag (Mw)	7.6

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: KIF-BF-CPT-5B

Water Elevation during CPT:	756.0	ft
Depth to Water during CPT:	13.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	754.0	ft
Depth to Water during Earthquake:	15.0	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	766	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-3.0	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	122	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.18	tsf

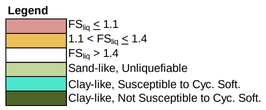
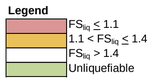
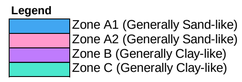
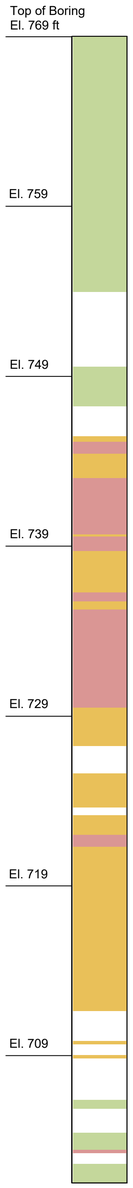
Elev. Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



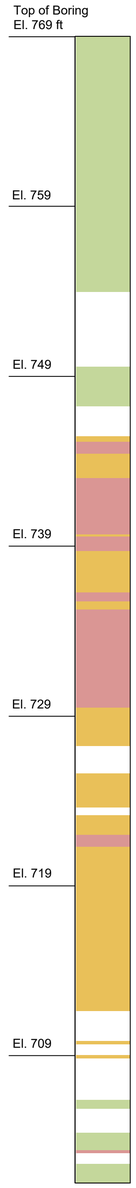




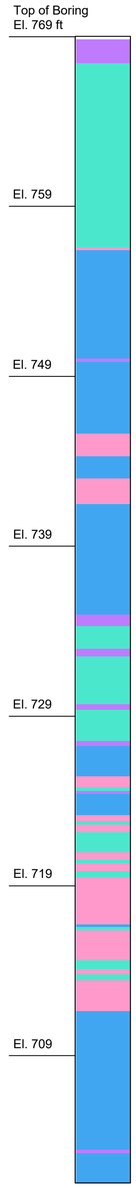
KIF-BF-CPT-5B, Liquefaction Triggering Results



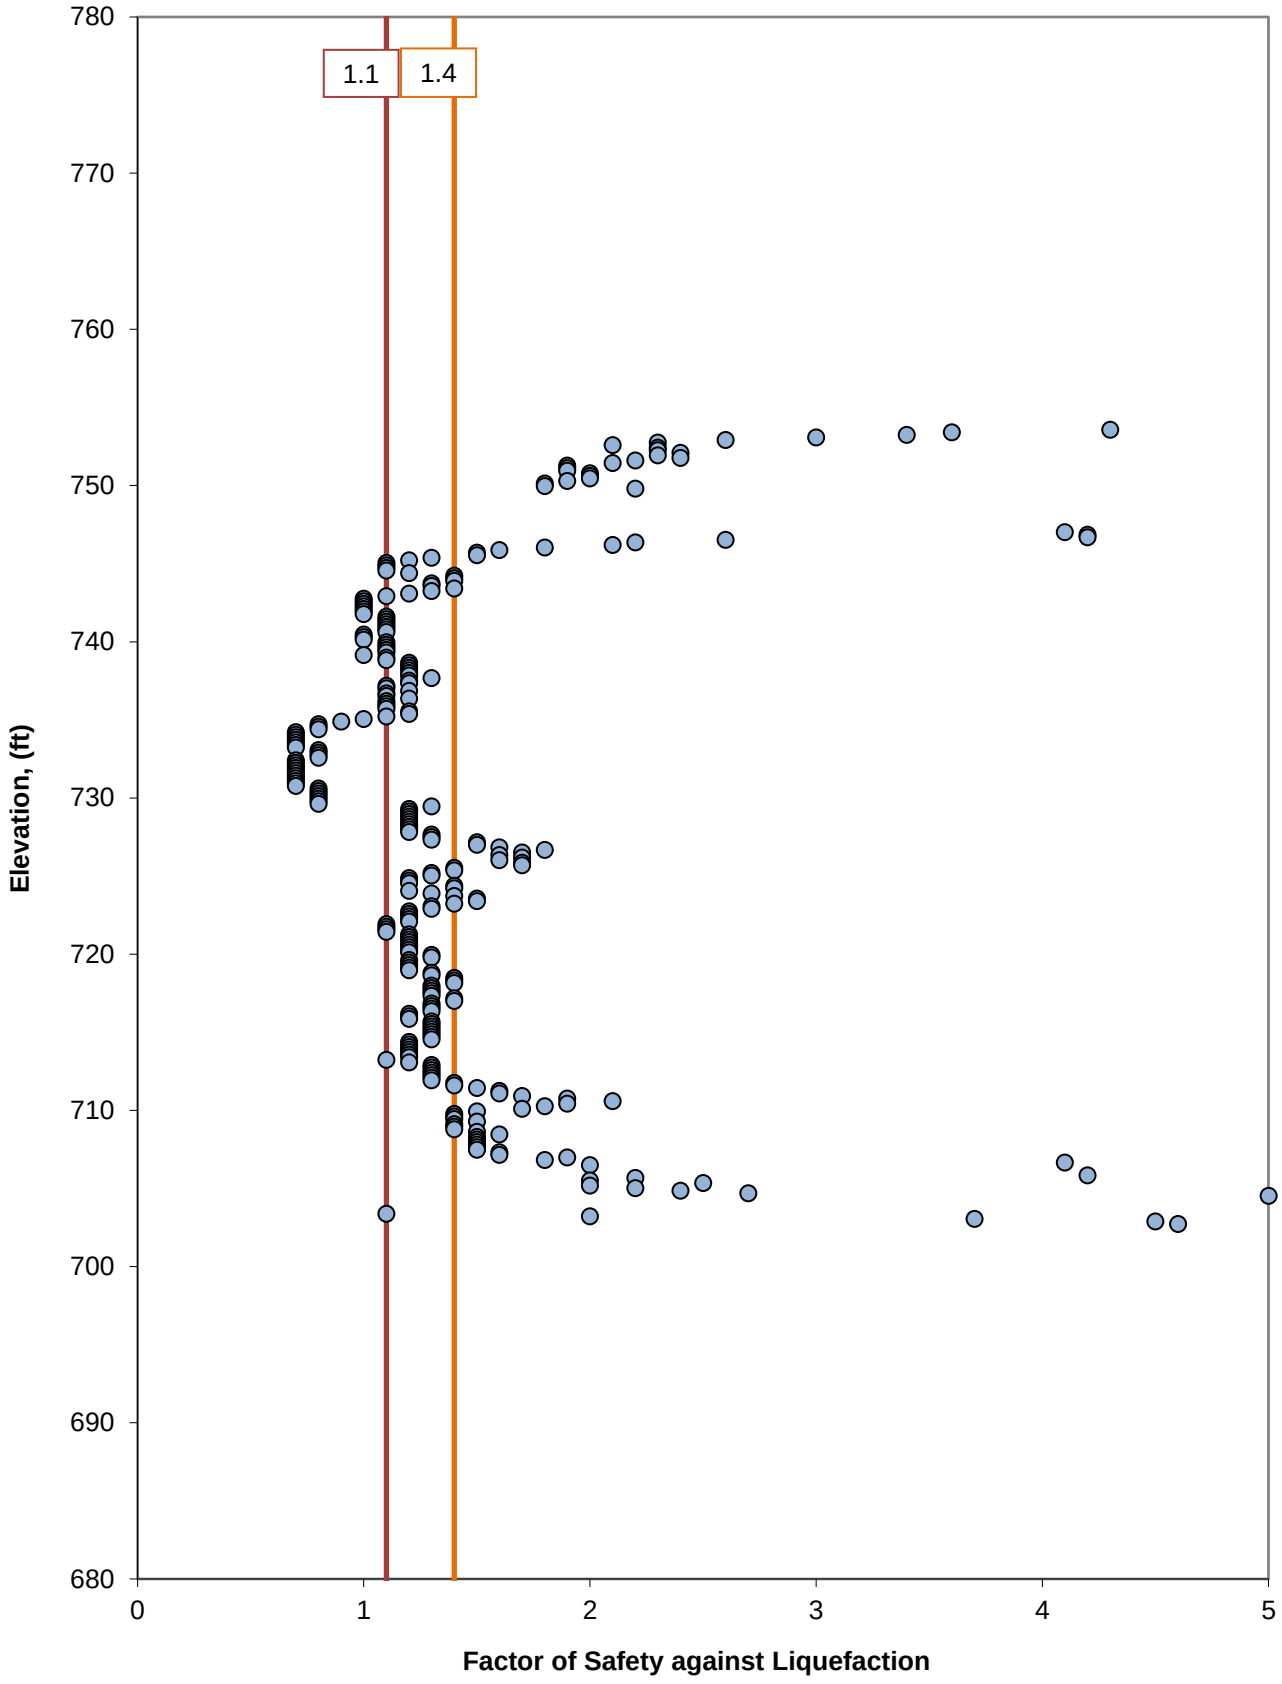
KIF-BF-CPT-5B, Liquefaction Triggering Results



KIF-BF-CPT-5B, Robertson Soil Type



KIF TDEC Stability, Boring = KIF-BF-CPT-5B, Source = 1 Hz, Mw = 7.6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



3.4.2 10 Hz Design Earthquake

Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-01B

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	755.0	feet
Water Depth during CPT (negative for U/S borings) =	3.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ =	755.3	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	Section_AA, KIF-A2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	Section_AA, KIF-A2_NOR	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	10 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.20
EQ Mag (Mw)	6.0

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-01B

Water Elevation during CPT:	752.0	ft
Depth to Water during CPT:	3.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	749.1	ft
Depth to Water during Earthquake:	5.9	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	755.3	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.3	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.02	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-01B**

Depth to Water during Earthquake:	5.9	ft
Final Grade Elevation during EQ:	755.3	ft
Height of Final Grade above CPT TOH:	0.3	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.20	g
Earthquake Magnitude:	6.00	M_W
Earthquake File or Source Zone:	10	Hz

Shear Stress Fit Parameters

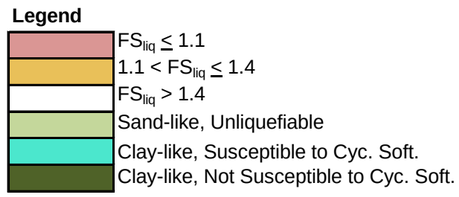
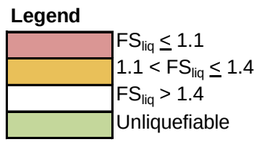
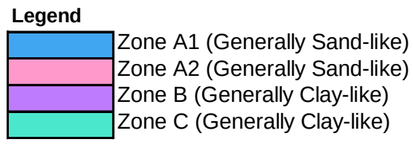
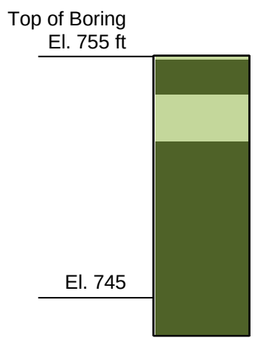
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



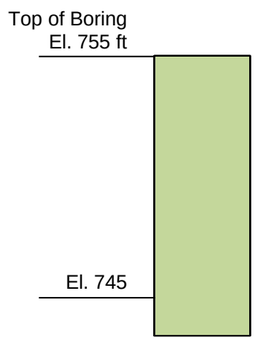




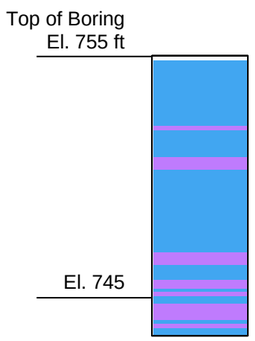
CPT-01B, Liquefaction Triggering Results



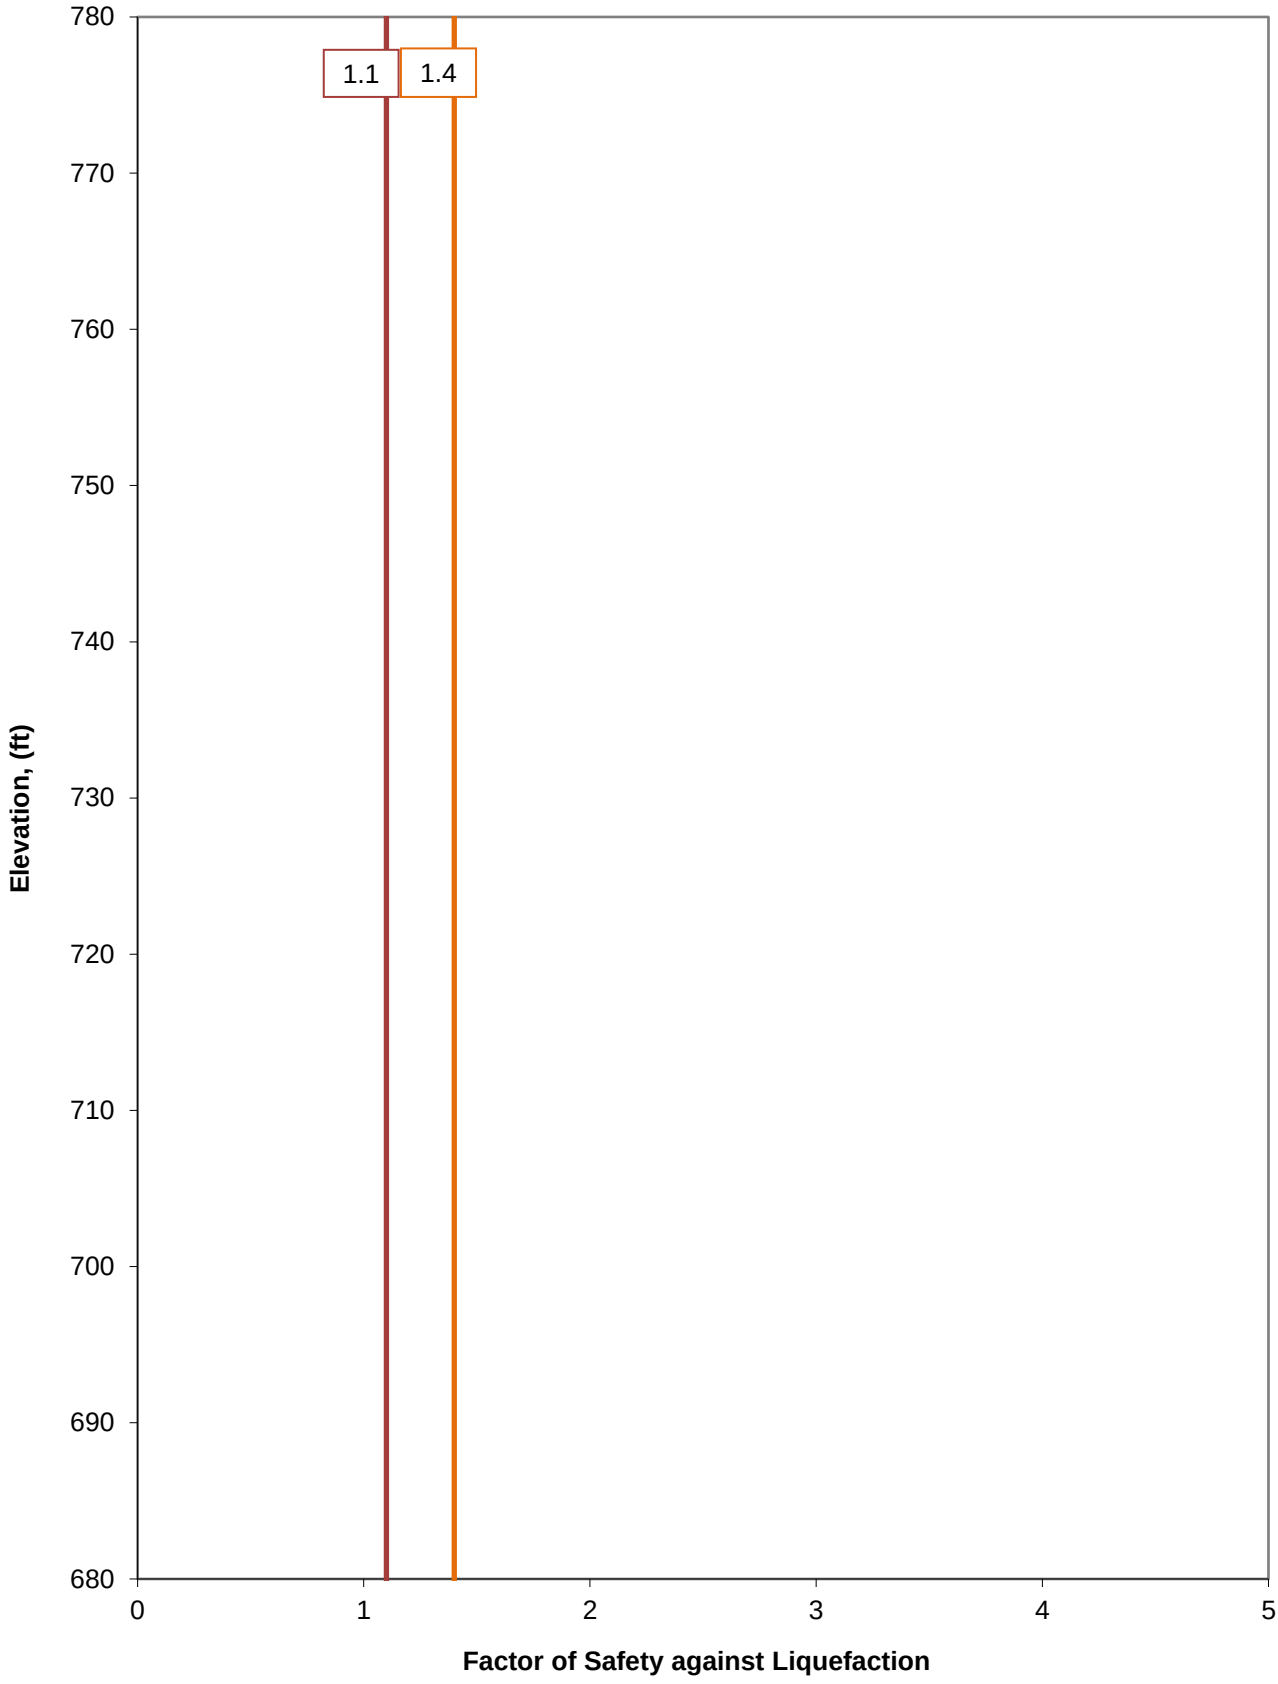
CPT-01B, Liquefaction Triggering Results



CPT-01B, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-01B, Source = 10 Hz, Mw = 6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-02D

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	755.0	feet
Water Depth during CPT (negative for U/S borings) =	2.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.9	feet
Final Grade Elevation during EQ =	755.3	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	Section_AA, KIF-A2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)
If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_α will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	Section_AA, KIF-A2_NOR	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	10 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.20
EQ Mag (Mw)	6.0

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-02D

Water Elevation during CPT:	753.0	ft
Depth to Water during CPT:	2.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	749.1	ft
Depth to Water during Earthquake:	5.9	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	755.3	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	0.3	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	0.02	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-02D

Elev. LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-02D**

Depth to Water during Earthquake:	5.9	ft
Final Grade Elevation during EQ:	755.3	ft
Height of Final Grade above CPT TOH:	0.3	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.20	g
Earthquake Magnitude:	6.00	M_W
Earthquake File or Source Zone:	10	Hz

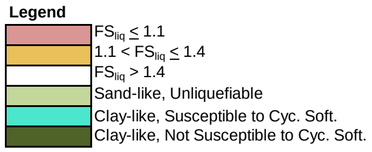
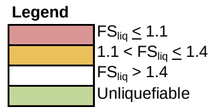
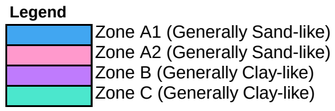
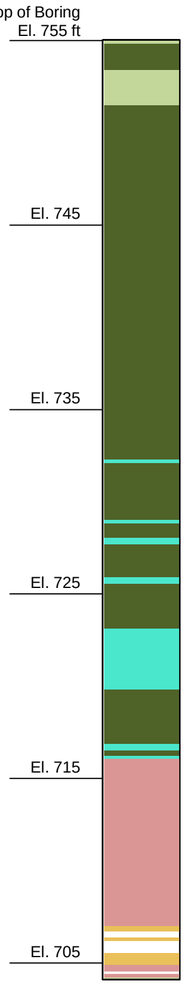
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



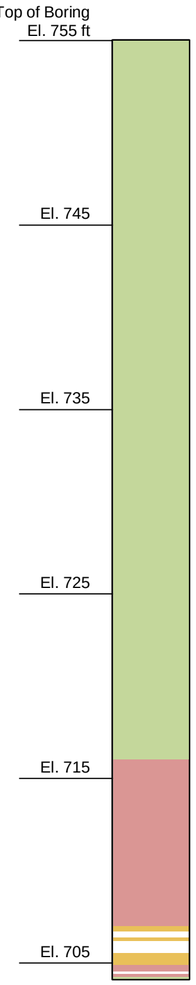




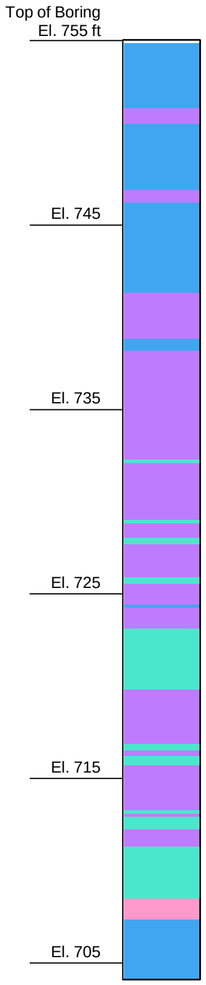
CPT-02D, Liquefaction Triggering Results



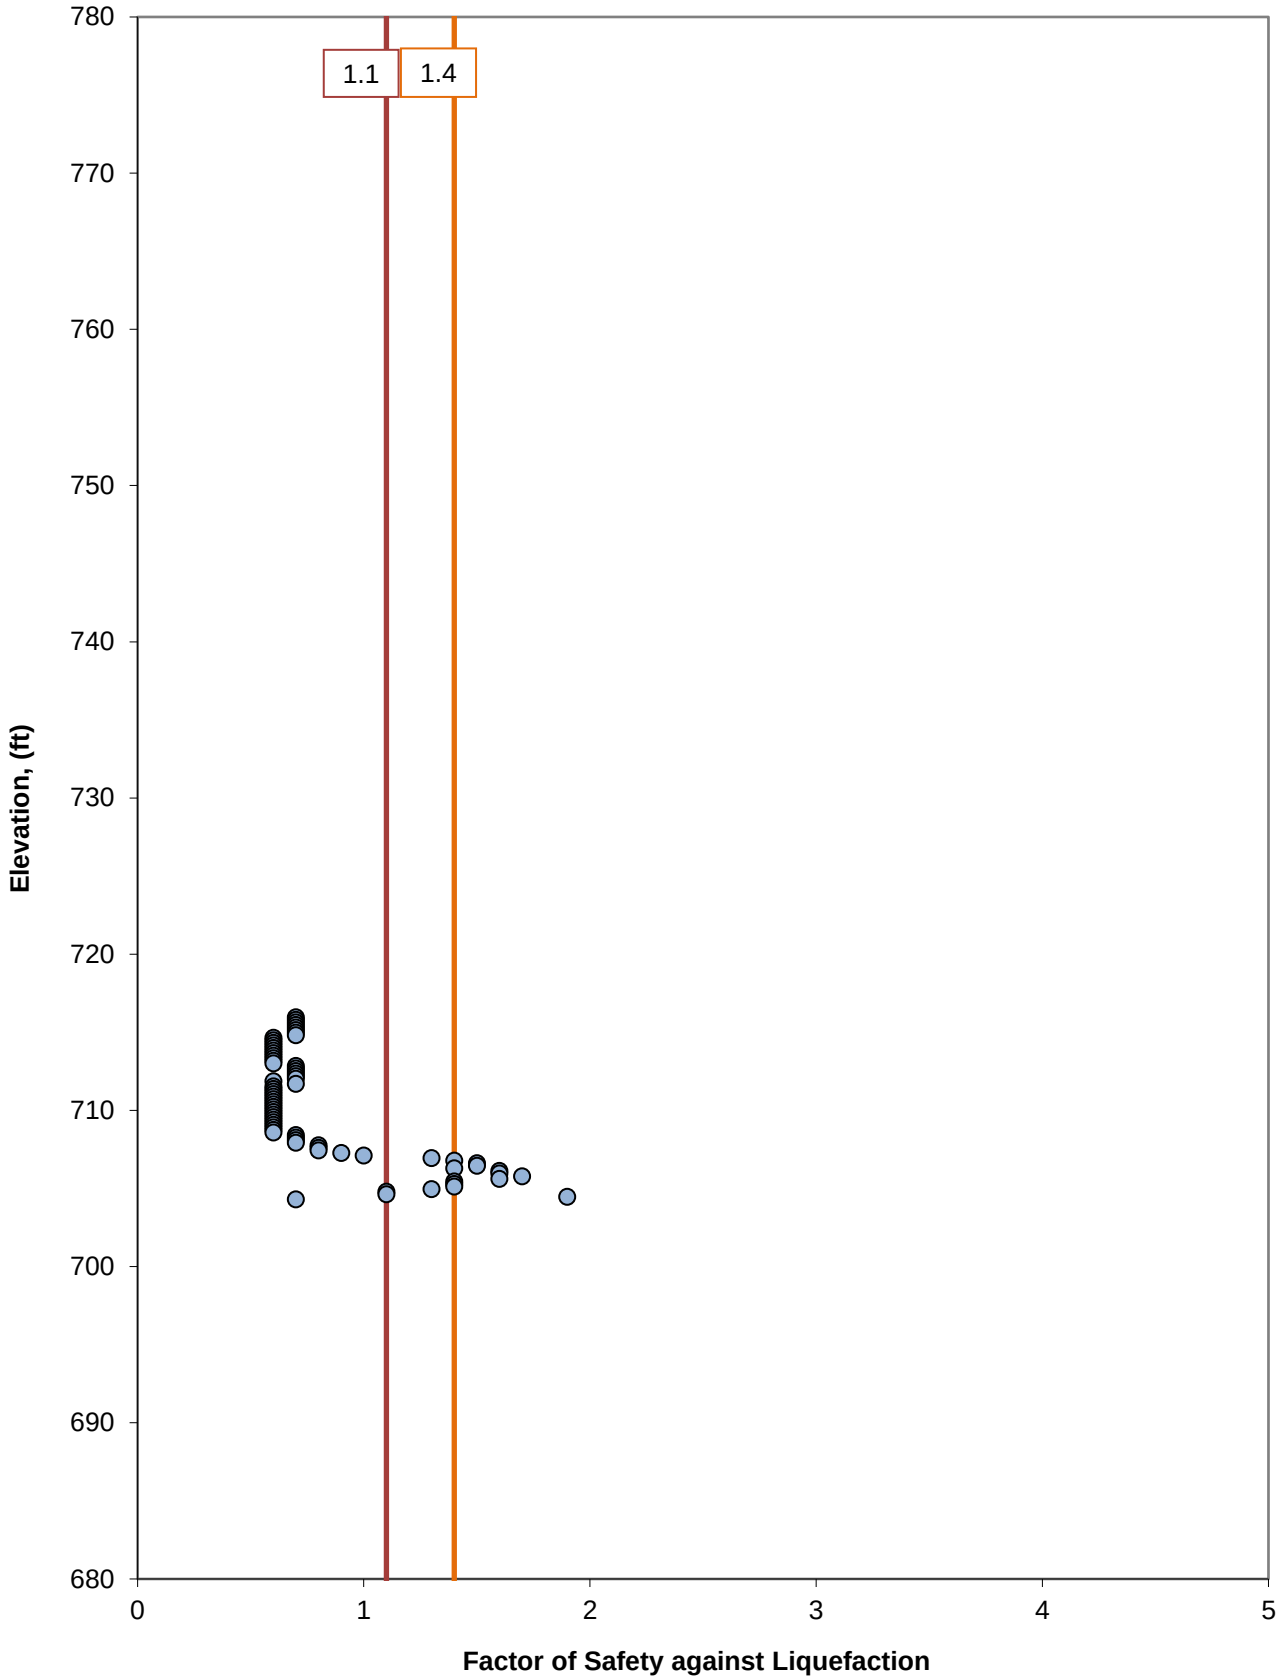
CPT-02D, Liquefaction Triggering Results



CPT-02D, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-02D, Source = 10 Hz, Mw = 6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-03C

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	754.0	feet
Water Depth during CPT (negative for U/S borings) =	4.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	5.3	feet
Final Grade Elevation during EQ =	753.8	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	Section_AA, KIF-A2_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_σ will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	Section_AA, KIF-CPT03_NOR	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	10 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.19
EQ Mag (Mw)	6.0

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-03C

Water Elevation during CPT:	750.0	ft
Depth to Water during CPT:	4.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	748.7	ft
Depth to Water during Earthquake:	5.3	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	753.8	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-0.2	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.01	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-03C**

Depth to Water during Earthquake:	5.3	ft
Final Grade Elevation during EQ:	753.8	ft
Height of Final Grade above CPT TOH:	-0.2	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.19	g
Earthquake Magnitude:	6.00	M_W
Earthquake File or Source Zone:	10	Hz

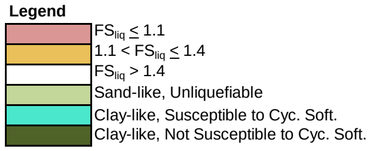
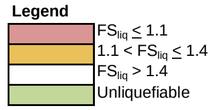
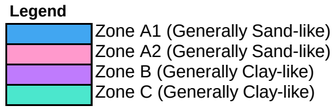
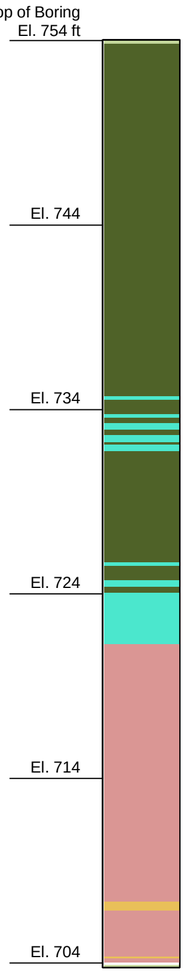
Adapted from "Discussion of 'Liquefaction Potential of Silts from CPTu'" (Robertson 2008). Zone A_1 and Zone A_2 samples are generally sand-like. Zone B samples are generally clay-like and not susceptible to cyclic softening. Zone C samples are generally clay-like and susceptible to cyclic softening. Note that the transition from clay-like to sand-like in this chart does not exactly match the liquefaction calculations herein; that is, some transitional samples in Zone B and Zone C will be treated as sand-like and analyzed for liquefaction if the calculations indicate as such.



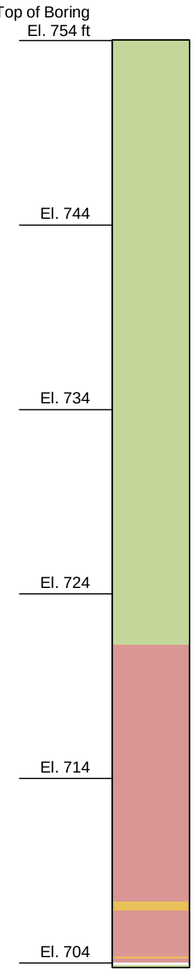




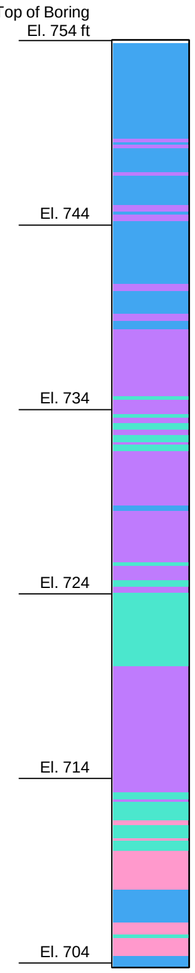
CPT-03C, Liquefaction Triggering Results



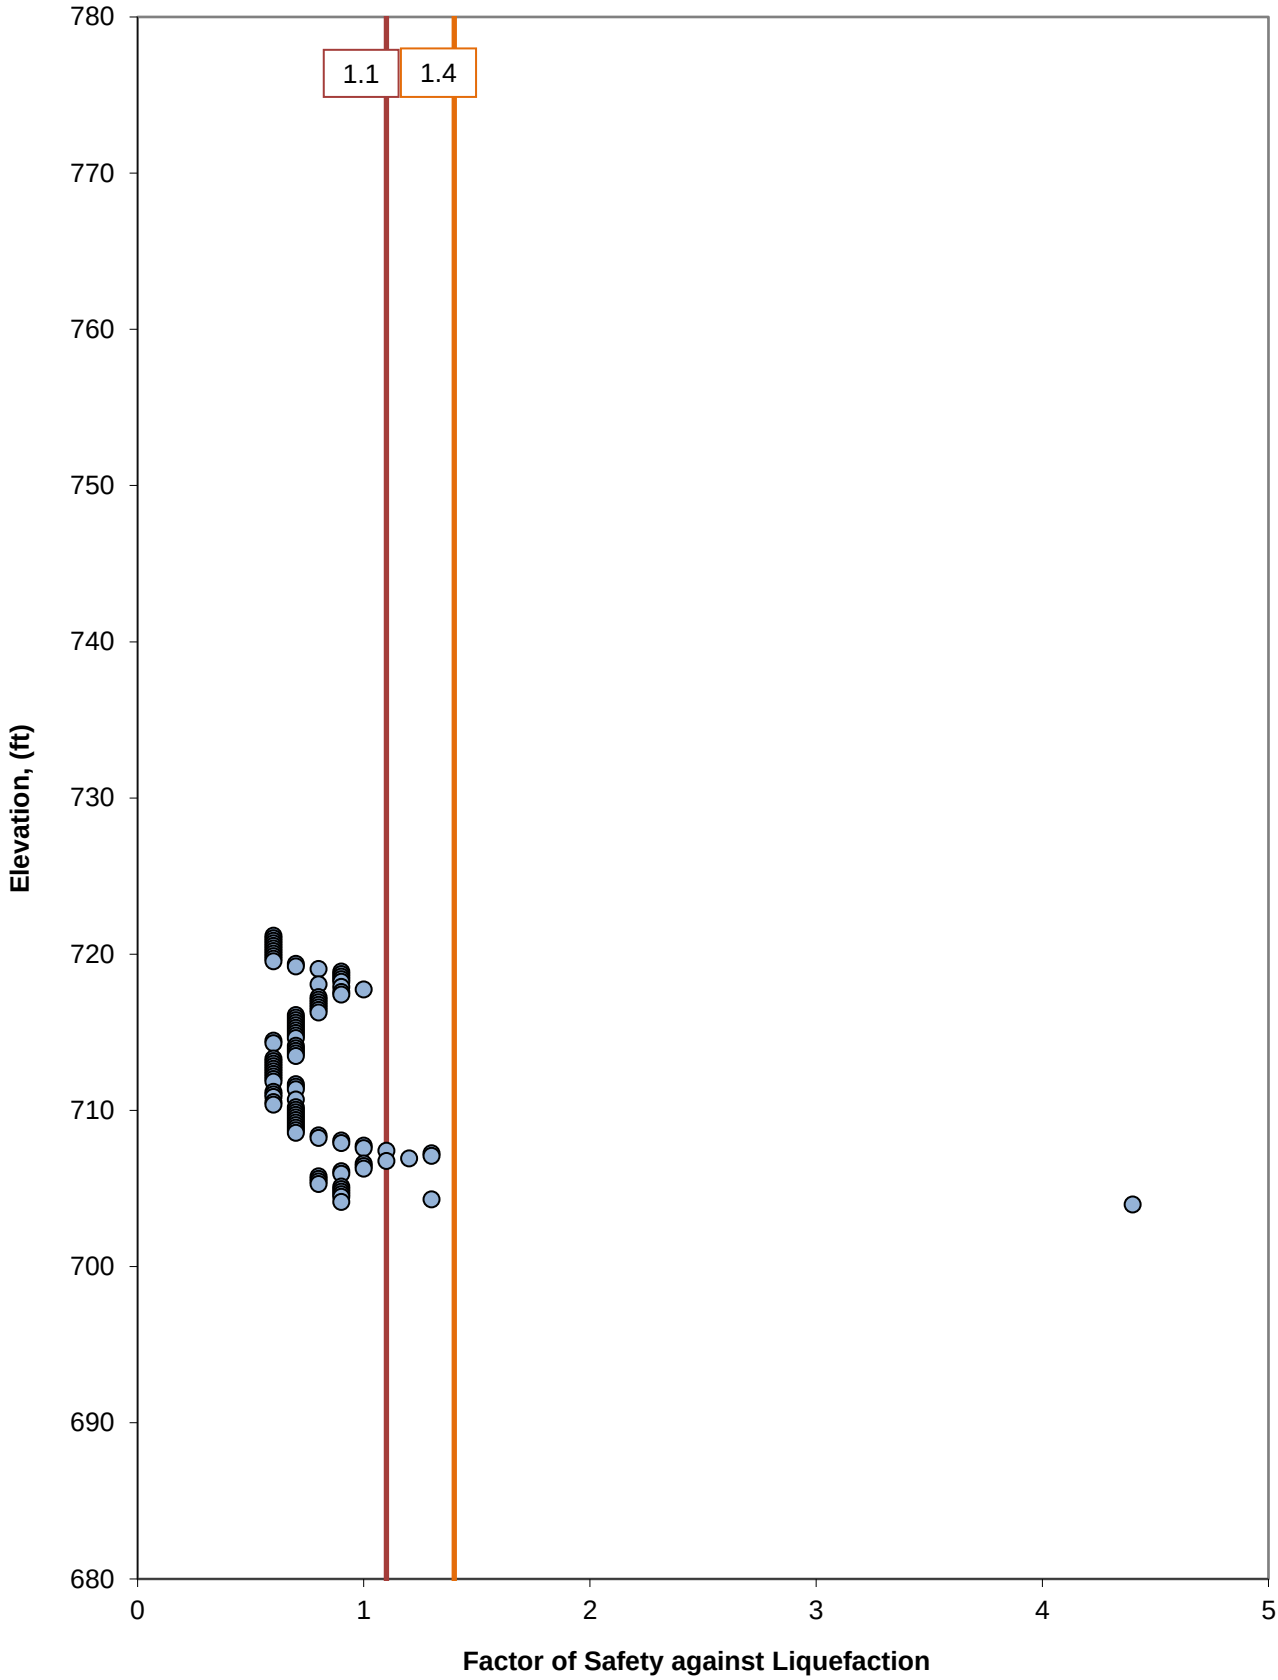
CPT-03C, Liquefaction Triggering Results



CPT-03C, Robertson Soil Type



KIF TDEC Stability, Boring = CPT-03C, Source = 10 Hz, Mw = 6, Event = Design EQ, CPT Data, Simplified Stress-Based Approach



Project Information

Stantec Project Number =	175668043
Project Name =	KIF TDEC Stability
CPT ID =	CPT-04A

Boring Location (optional)

Northing =	
Easting =	

OR

Baseline Station =	
Offset (+ Right) =	

Using qt (corrected for u2 PWP) or qc (backcalculated uncorrected field tip)

Cone ID (optional) =	AD184	
Use qc instead of qt?	0	(1: Yes, 0: No)
Cone Area Ratio (a) =	0.80	

Drilling Information

Top of Hole Elevation =	753.0	feet
Water Depth during CPT (negative for U/S borings) =	6.0	feet
Depth data collection began =	0.16	feet
Avg. Total Unit Wt. Above 1st Sample =	120.00	pcf

During Earthquake Information

Water Depth during EQ (relative to CPT TOH, negative for U/S borings) =	4.6	feet
Final Grade Elevation during EQ =	752.2	feet
Avg. Total Unit Wt. of Cut/Fill =	120	pcf

Nonlinear Pore Water Pressure Profile

Custom Pore Water Pressure Profile?	0	(1: Yes, 0: No)

If previous answer is No, hydrostatic pressures are assumed.

α Curve Fit Parameters

Associated α profile:	ng_Pond_Section, KIF-BF-SPT3_NOR	
α at each Sample Depth known?	1	(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (α vs. depth curve)

If defaulting to K_α=1 (i.e., level ground), assign values of zero to all curve fit parameters below to make alpha zero and thus, K_σ will be one.

m4:	
m3:	
m2:	
m1:	
m0:	

Associated ground response profile:	shing_Pond_Section, KIF-BF-SPT3	
Get CSR from shear stress envelope?	0	(1: Yes, 0: No)

If previous answer is No, then CSR will be calculated using a_{max} and r_d

Max. Shear Stress at each sample depth known?		(1: Yes, 0: No)

If previous answer is No, then enter curve fit parameters below (shear stress vs. depth curve)

Max. Shear Stress Curve Fit Parameters (from ground response analysis)

m4:	
m3:	
m2:	
m1:	

Earthquake Information

EQ Source (e.g., New Madrid)	10 Hz
Event (e.g., MCE, OBE)	Design EQ
a_{max} (g) (top of ground surface)	0.21
EQ Mag (Mw)	6.0

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Facility: KIF TDEC Stability
Project No.: 175668043
CPT ID: CPT-04A

Water Elevation during CPT:	747.0	ft
Depth to Water during CPT:	6.0	ft *(relative to ground surface during CPT)*
Water Elevation during Earthquake:	748.4	ft
Depth to Water during Earthquake:	4.6	ft *(relative to ground surface during CPT)*
Final Grade Elevation during EQ:	752.2	ft *(if no fill, then set this equal to top of CPT hole elev.)*
Height of Final Grade above CPT TOH:	-0.8	ft *(relative to ground surface during CPT, + Fill, - Cut)*
Unit Weight of Cut/Fill to Achieve Final Grade	120	pcf
Cut/Fill Total Stress (+ Fill, - Cut):	-0.05	tsf

LIQUEFACTION POTENTIAL ASSESSMENT FOR COARSE GRAINED SOILS USING CONE PENETRATION TEST DATA

Project Site: **KIF TDEC Stability**
Stantec Project No.: **175668043**
CPT ID: **CPT-04A**

Depth to Water during Earthquake:	4.6	ft
Final Grade Elevation during EQ:	752.2	ft
Height of Final Grade above CPT TOH:	-0.8	ft
Normalize K_σ to:	1.058	tsf
a_{max} at top of ground surface:	0.21	g
Earthquake Magnitude:	6.00	M_W
Earthquake File or Source Zone:	10	Hz

Shear Stress Fit Parameters
